n: Hydrologic Problems in Karst Regions; Proceedings of Symposium held at Western Kentucky Jniversity, Bowling Green, Kentucky, April 26-9, 1976. Department of Geography and Geology, Vestern Kentucky University, Bowling Green, Kentucky, p 41-49, 1977. 2 fig, 11 ref.

Descriptors: *Karst, *Topography, *Kentucky, Geomorphology, Drainage, Caves, Regional development, Carbonate rocks, Sinks, Shape, Springs.

Selected aspects of karst processes and resulting opography and drainage were reviewed. Solution rocesses, drainage characteristics, and surface and ubsurface topographic features were summarized rom existing literature. The interior lowlands of entral Kentucky include excellent examples of arst regions. The limestone beds of the area are Carboniferous (Mississippian). In the far north, the imestone is covered by glacial deposits, but in the outhwestern portion of the state the limestone is generally covered only by shallow soil. Karst has leveloped on two distinct landform units. Located n the southwestern portion of this region is the lain known as the Pennyroyal and to the northvest is the Mammoth Cave Plateau, also referred o as the Chester Cuesta. The Dripping Springs Chester) Escarpment serves as a boundary beween the two. On a topographic map this is a very listinctive feature with relief of 65 to 130 m. From he ground it is less noticeable because of dissection that has altered it. In general, the karst area of Kentucky varies a slight degree from one area to nother. Landforms in different stages of development may be noted, and the occurrence of caves varies to some degree. Yet, the landforms which re present are unmistakable landforms of karst opography. REVIEW OF THE PHYSICAL HYDROLOGY OF THE CENTRAL KENTUCKY KARST,
National Park Service, Mammoth Cave, KY. Uplands Research Lab.
J. F. Quinlan, and D. . Rowe.
In: Hydrologic Problems in Karst Regions; Proceedings of Symposium held at Western Kentucky University, Bowling Green, Kentucky, April 26-29, 1976. Department of Geography and Geology, Western Kentucky University, Bowling Green, Kentucky, p 50-63, 1977. 6 fig, 18 ref. OWRT A-062-KY(2).

Descriptors: *Karst hydrology, *Kentucky, *Groundwater, *Groundwater basins, Water pollution, Reviews, Karst, On-site investigations, Tracers, Sinks, Limestones, Caves, Aquifers, Groundwater movement, Drainage area, Hydrologic aspects, Stratigraphy, Geology, Drainage system, Subsurface drainage.

The Pennyroyal Plateau in central Kentucky consists of the Sinkhole Plain and the Glasgow Upland - each of which is underlain by Mississippian carbonates that gently dip in directions ranging from north to west. The Sinkhole Plain is flanked on the north by the sandstone-capped Chester Escarpment and Chester Cuesta. The occurrence and movement of groundwater in the Principal Aquifer is traced from the highest recharge area, just beyond the south and east margin of the Sinkhole Plain. Water is found in numerous small swamps of the Glasgow Upland, which feed perennial springs that feed streams that sink at this margin. Water from the swallets flows to cave streams. These low-order tributary streams join intermediate-order tributaries and, finally, a high-order trunk stream that discharges at a major spring along Green River, Barren River, or Little Barren River. The streams that flow beneath the Sinkhole Plain are fed also by runoff into sinkholes and direct infiltration. The streams that drain beneath the Chester Cuesta may be fed not only from the Sinkhole Plain, but also by runoff from ridge tops, infiltration from karst valleys, and by spring discharge from two perched aquifers. Dye-tracing over distances of as much as 24 km has begun to delineate the major groundwater basins. Systematic location of numerous caves and sinkholes in which subsurface streams are intercepted as they flow to their base level outlet, as well as mapping of selected major caves that serve as groundwater conduits, has yielded unique and valuable information about the nature of the dendritic plumbing system that drains the upper part of the Principal Aquifer. Thirteen groundwater basins have been recognized; all but 2 of them are characterized by distributary complexes 50 m to 4 km wide which discharge at 1 or several springs at each of 2 to 14 locations. Only 1 regional spring, Turnhole, lacks a distributary complex. Trunk conduits are commonly as much as 14 m wide. Water levels in them fluctuate as much as 30 m in response to storms. SUMMARY OF GEOHYDROLOGIC RELATIONSHIPS IN THE LOST RIVER WATERSHED, INDIANA, APPLIED TO WATER USE AND ENVIRONMENT,
Indiana Univ. at Bloomington. Dept. of Geology.
R. V. Ruhe.
In: Hydrologic Problems in Karst Regions; Proceedings of Symposium held at Western Kentucky University, Bowling Green, Kentucky, april 26-29, 1976. Department of Geography and Geology, Western Kentucky University, Bowling Green, Kentucky, p 64-78, 1977. 7 fig, 27 ref.

Descriptors: *Karst hydrology, *Hydrogeology, *Watersheds(Basins), *Indiana, Geomorphology, Sinks, Reviews, Karst, Aquifers, Water balance, Geology, Climate, Hydrology, Hydrological aspects, Water quality, *Lost River(Indiana).

Quantitative relations among surface water and groundwater hydrology and geomorphology and soils were evaluated. Principles were formulated for defining karst-aquifer features that control water balance. Specific goals were to determine the hydrologic system of the karst of the Mitchell Plain of south central Indiana. Study topics include: (1) geomorphology of the karst terrain including surface materials and bedrock topography relative to sinkholes, etc.; (2) soils, including retention and storage capacity, permeability and transmissivity, and ability to enhance runoff; (3) water budget, including runoff, evapotranspiration, subsurface flow, spring flow, subsurface storage, and hydrochemical nature of the water; and (4) water use and environment, including water supply and potential contamination. Sample areas were selected as models for field and laboratory work and fitted to the watershed for quantitative estimate of the whole system. (See also W79-01932) (Humphreys-ISWS)

A PRELIMINARY INVESTIGATION ON SEISMIC TECHNIQUES USED TO LOCATE CAVITIES IN KARST TERRAINS,
Chester Engineers, Inc., Coraopolis, PA. Geotechnical Dept.
K. G. Kirk, and E. R. Snyder.
In: Hydrologic Problems in Karst Regions; Proceedings of Symposium held at Western Kentucky University, Bowling Green, Kentucky, April 26-29, 1976. Department of Geography and Geology, Western Kentucky University, Bowling Green, Kentucky, p 79-91, 1977. 12 fig, 7 ref.

Descriptors: *Karst, *Exploration, *Seismic studies, *Subsurface investigations, *West Virginia, Seismology, Geology, On-site tests, Surveys, Seismic waves, Limestones, Instrumentation, Theoretical analysis, Analytical techniques, Seismographs, Data processing, Caves, *Organ Cave(WVA).

Shallow hammer reflection seismology was used in conjunction with a signal enhancement seismograph in an attempt to locate cavities in karst terrains. The use of compressional wave (P wave) reflections and shear (SH) wave reflections was investigated to determine their usefulness in locating cavities. Results indicated that both P and SH wave reflections can be used to locate cavities. The SH wave reflections appear to delineate cavities better than P wave reflections. Success with this technique so far suggests that it can be used as a useful tool in engineering reconnaissance and land use planning. (See also W79-01932) (Humphreys-ISWS)

THE A, B, C'S OF FINDING AND DELINEATING CAVES WITH APPARENT RESISTIVITY MEASUREMENTS,
Monongahela National Forest, Elkins, WV.
T. R. Manley, and E. R. Garton, Jr.
In: Hydrologic Problems in Karst Regions; Proceedings of Symposium held at Western Kentucky University, Bowling Green, Kentucky, April 26-29, 1976. Department of Geography and Geology, Western Kentucky University, Bowling Green, Kentucky, p 92-95, 1977. 4 fig.

Descriptors: *Caves, *Karst, *Locating, *West Virginia, Exploration, Methodology, Surveys, Electrical resistivity, Resistivity, Limestones, Analytical techniques.

During investigation into the effects of highway construction on the hydrogeologic environment at Bowden, West Virginia, a technique for finding and delineating limestone caverns from the surface was developed. These caverns are aquifers to the large springs which supply the Bowden National Fish Hatchery with water for all of its operations. The technique use for finding and delineating these caves was apparent resistivity measurements. After interpretation of these measurements, the results were confirmed with boreholes. GEOPHYSICAL INVESTIGATIONS OVER KARST WATER IN SOUTHEASTERN MISSOURI,
Rhode Island Univ., Kingston. Dept. of Geology.
R. K. Frohlich, and G. P. Smith.
In: Hydrologic Problems in Karst Regions; Proceedings of Symposium held at Western Kentucky University, Bowling Green, Kentucky, April 26-29, 1976. Department of Geography and Geology, Western Kentucky University, Bowling Green

Kentucky, p 96-106, 1977. 9 fig, 1 tab, 7 ref. OWRT A-065-MO(2).

Descriptors: *Karst, *Missouri, *Exploration, *Geological surveys, Karst hydrology, Geophysics, Sounding, Electrical studies, Aquifers, Gravity studies, Geology, Resistivity, Surveys, Limestones.

The disappearance of streams and the subsurface transport of water through cavities and stream channels occur frequently in karst terranes. A characteristic area of such phenomena is the southeastern part of Missouri. The disappearance of a small river in this area is believed to be fault-controlled. Geoelectrical depth soundings and gravity investigations produced anomalies, which can be explained by near surface river deposits and the local karst development. The depth soundings after Schlumberger indicate a conductive overburden between 40 and 50 m. No significant change of its thickness profile shows a negative anomaly of -2.0 mgal with a width of nearly 4.5 km. Simplified model calculations consider the external gravity effect caused by the density contrast of karstified versus compact limestone. An almost equal contribution to the gravity anomaly originates from the density contrast of alluvial river deposits versus karstified limestone. The semiquantitative gravity interpretation suggests larger depths of karstification than the thickness of the geoelectrically observed overburden implies. Small-scale limestone dissolutions in the order of 10% can produce substantial gravity lows. However, this would not show on a resistivity depth sounding if the fissures are filled with air or clear water. The gravity survey suggests that extensive karstification occurred near the fault planes. The material, most likley, consists of a weaker rock near the fault than in the surrounding area. The mechanicaly weaker rock is more subject to chemical dissolution when it comes in contact with erosional water. (See also W79-01932) (Humphreys-ISWS)

ALPHA RADIATION MONITORING OF NATIONAL PARK SERVICE ADMINISTERED CAVES IN UNITED STATES,
National Park Service, Santa Fe, NM. Southwest Region.
K. A. Yarborough, and G. M. Ahlstrand.
In: Hydrologic Problems in Karst Regions; Proceedings of Symposium held at Western Kentucky University, Bowling Green Kentucky, April 26-29, 1976. Department of Geography and Geology, Western Kentucky University, Bowling Green, Kentucky, p 107-116, 1977. 1 tab, 6 ref.

Descriptors: *Caves, *Radiation, *Monitoring, *United States, *Public health, Radioactivity, Background radiation, Hazards, Standards, Surveys, On-site investigations, Radioisotopes, Alpha radiation, Radiation exposure, Radon gas, Thoron gas.

The United States National Park Service (NPS) has conducted a preliminary survey of alpha radiation in NPS administered caves. This radiation is produced by the radioactive decay of Radon and Thoron gases, which in turn result from Uranium and Thorium decay. These latter elements are found in all terrestrial rocks and soils in varying, though minute, concentrations. The decay products of the two noble gases which cause a potential health hazard are the short lived 'daughters.' These are solids. This decay yields the alpha radiation which as a large ionizng effect on lung tissues. Continuous exposure of many years (5 or more) may cause lung cancer. Lung cancer has been documented to be anomalously high among uranium miners. Smoking has a contributory effect which greatly increases the radiation health hazard. Health standards are set by several government agencies: Environmental Protection Agency, Occupational Safety and Health Administration, Mining Enforcement and Safety Administration (MESA), and National Institute for Occupational Safety and Health. The NPS research has the dual but complementary objectives: (1) To safeguard health at the NPS administered caves, and (2) To develop data on alpha radiation levels and on natural airflows in caves. The results can be used by various agencies to clarify health standards for exposures to lower radiation levels in cave environments. All persons who spend considerable time underground in caves may be exposed to alpha radiation produced by the radioactive decay of radon and thoron gases. Therefore, underground areas should be monitored for this radiation, and exposures should be computed using the procedures, equipment, and standards of MESA and other agencies as described. W79-01943

DISTRIBUTION AND DENSITY OF DOLINES IN AREAS OF MANTLED KARST,
Iowa State Univ., Ames. Dept of Earth Sciences.
R. C. Palmquist.
In: Hydrologic Problems in Karst Regions; Proceedings of Symposium held at Western Kentucky University, Bowling Green, Kentucky, April 26-29, 1976. Department of Geography and Geology, Western Kentucky Univ., Bowling Green, Kentucky, p 117-129, 1977. 8 fig, 2 tab, 16 ref.

Descriptors: *Karst, *Iowa, *Geological investigations, Surveys, Glacial drift, Statistical methods, Analysis, Analytical techniques, Distribution patterns, Spatial distribution, *Dolines, Mantled karst.

The karstic area of Iowa is mantled with drift of Nebraskan, Kansan, and Wisconsinan ages. Ansalysis of doline densities within these drift sheets and of doline distribution within a portion of the Nebraskan drift sheet indicated both temporal and environmental controls. Doline density varies directly with the age of the land surface according to a log age model. This model suggested that doline initiation occurs about 5,000 years after the surface originates with very rapid decrease in the rate of doline initiation occurring about 250,000 years after surface origination. Within two townships in Allamakee County, doline density varies with local environmental controls. Multiple regression analysis indicated that the density of major dolines varies inversely with local relief and extent of surface drainage, but directly with area of Fayette soil. The density of minor dolines varies directly with area of Fayette soil and inversely with local relief. These relationships were interpreted to indicate that the major control on doline density is the amount of groundwater recharge, though for major dolines, aquifer permeability and lithology are also important. MORPHOMETRIC ANALYSIS OF DOLINES FOR PREDICTING GROUND SUBSIDENCE, MONROE COUNTY, WEST VIRGINIA,
West Virginia Univ., Morgantown. Dept. of Geology and Geography.
A. E. Ogden, and J. P. Reger.
In: Hydrologic Problems in Karst Regions; Proceedings of Symposium held at Western Kentucky University, Bowling Green, Kentucky, April 26-29, 1976. Department of Geography and Geology, Western Kentucky University, Bowling Green Kentucky, p 130-139, 1977. 10 fig, 3 tab, 8 ref.

Descriptors: *Karst, *West Virginia, *Land subsidence, *Geomorphology, Subsidence, Limestones, Analysis, Analytical techniques, Geology, Carbonate rocks, Stratigraphy, *Dolines, *Monroe County(W Va), Greenbrier limestone.

Morphometric analysis of dolines shows promise as a useful tool in identifying ground subsidence susceptibility for land use planning. Seven carbonate formations of the Greenbrier limestone group were mapped in central Monroe County, West Virginia, on 7.5-min topographic maps. A doline map was prepared from aerial photographs and transferred to similarly scaled maps. Results indicated different formations with the Greenbrier limestone process relatively distinctive doline distributions. The percentage of limestone area in dolines and the doline density (number of dolines per square mile of limestone are useful indicators of areas of potential subsidence and, furthermore, coincide with total cave footage. The implication is that areas underlain by the most cavernous rock units display the greatest areal and frequency percents of dolines. A ground subsidence susceptibility map, combining areas of optimum hillslope steepness and percent area in dolines, shows those areas considered the most suitable for locating major manmade structures. It was concluded that, in general, the Pickaway limestone is the single most suitable formation upon which to build major structures with minimum risk of subsidence, whereas the Patton and Union formations should be avoided. CONCEPTUAL MODELS FOR CARBONATE AQUIFERS: REVISITED,
Pennsylvania State Univ., University Park. Materials Research Lab.; and Pennsylvania State Univ., University Park. Dept. of Geosciences.
W. B. White.
In: Hydrologic Problems in Karst Regions; Proceedings of Symposium held at Western Kentucky University, Bowling Green Kentucky, April 26-29, 1976. Department of Geography and Geology, Western Kentucky University, Bowling Green, Kentucky, p 176-187, 1977. 4 fig, 2 tab, 13 ref.

Descriptors: *Karst hydrology, *Aquifers, *Model studies, *Hydrogeology, *Unsteady flow, Carbonate rocks, Base flow, Groundwater, Geology, Karst, Petrology, Subsurface waters, Flow, Water balance, Hydrographs, Discharge(Water), Perched water, Drainage area.

A conceptual scheme for classifying carbonate aquifers in terms of groundwater flow system and hydrogeologic setting originally proposed in 1969 was revised and extended to include factors of relief, structure, and areal extent of the aquifer. Structural and topographic setting was shown to act mainly through determining the arrangement of karstic rocks with respect to sources of recharge and points of discharge. Lithologic and stratigraphic factors control the degree to which conduit permeability is developed. It was shown that a distinction between diffuse flow (fracture) aquifer systems and conduit flow systems can be made in terms of their response to transient recharge events. The effects of transients is more pronounced in aquifer systems of high relief. The vaue of conceptual classifications is that they permit one to identify particular aquifer types and also indicate some of the variables that should be incorporated into quantitative models of aquifer behavior. STORAGE PROPERTIES OF FRACTURED FORMATIONS,
Birmingham Univ. (England). Dept. of Civil Engineering.
T. D. Streltsova.
In: Hydrologic Problems in Karst Regions; Proceedings of Symposium held at Western Kentucky University, Bowling Green, Kentucky, April 26-29, 1976. Department of Geography and Geology, Western Kentucky University, Bowling Green, Kentucky, p 188-192, 1977. 1 tab, 3 ref.

Descriptors: *Aquifers, *Water storage, *Model studies, *Karst, Mathematical models, Permeability, Porosity, Flow, Equations, Analytical techniques, Fracture permeability, Deformation, Theoretical analysis, Water wells, Pumping.

Response mechanism of a fractured aquifer to a pressure change due to pumping was considered. An aquifer in a state of equilibrium is characterized by a certain form of the stress-strain relationship.

This defines the state of stress within the aquifer, in both the solid skeleton of the rock and the fluid in the voids of the rock. Every change in the state of stress produces a certain change in the stress-strain-time relationship; pore pressure decline causes compression of the rock's skeletal structure and expansion of the fluid contained in the voids, while increase in the fluid pressure causes expansion of the solid skeleton and compression of the fluid. A certain amount of time is required for a new specific stress-strain relationship to occur. A general differential equation for the flow to a well was derived. (See also W79-01932) (Humphreys-ISWS)

FAULTS AS POSITIVE AND NEGATIVE INFLUENCES ON GROUND-WATER FLOW AND CONDUIT ENLARGEMENT,
Texas Univ. at Austin. Dept. of Geological Sciences; and Texas Univ. at Austin. Bureau of Economic Geology.
E. H. Kastning.
In: Hydrologic Problems in Karst Regions; Proceedings of Symposium held at Western Kentucky University, Bowling Green, Kentucky, April 26-29, 1976. Department of Geography and Geology, Western Kentucky University, Bowling Green, Kentucky, p 193-201, 1977. 5 fig, 12 ref.

Descriptors: *Karst, *Faults(Geologic), *New York, *Virginia, *West Virginia, *Texas, Flow, Groundwater movement, Hydrology, Base flow, Carbonate rocks, Caves, Aquifers, Fractures(Geologic), Springs, Flow control, Fault zones.

Faults and fault zones within rocks generally are regarded as zones of higher permeability and of greater dissolutional enlargement of conduits than are joints or bedding-plane partings within an aquifer. These views are generally correct. However, recent investigations have indicated that, in some cases, faults have either not influenced karst groundwater flow, or have behaved as insoluble zones, retarding groundwater movement. Faults act as positive influences on groundwater flow where they have increased permeability by increasing fracture density or structurally weakening the bedrock. As negative influences, faults impede groundwater flow at an impermeable fault-plane, divert flow to other horizons, direct flow along the fault plane, or force waters to surface springs. Futhermore, flow paths have been unaltered by faults in some cases. The effects of faults vary with the structure and texture of the fault surfaces which, in turn, are determined by limestone composition, local pressure-temperature relationships during tectonism, and the nature of compressional or tensional forces during faulting. As no general statement of fault influence on the karst groundwater regime or conduit development can be made, each fault in question must be examined in detail. (See also W79-01932) (Humphreys-ISWS)

MODEL ANALYSIS OF CLOSED SYSTEMS IN KARSTIC AQUIFERS,
Iowa State Univ., Ames. Dept. of Earth Sciences.
Y. Basmaci, and L. V. A. Sendlein.
In: Hydrologic Problems in Karst Regions; Proceedings of Symposium held at Western Kentucky University, Bowling Green, Kentucky, April 26-29, 1976. Department of Geography and Geology, Western Kentucky University, Bowling Green, Kentucky, p 202-213, 1977. 7 fig, 1 tab, 19 ref.

Descriptors: *Karst, *Aquifers, *Model studies, *Groundwater movement, Baseflow, Numerical analysis, Computer models, Analysis, Analytical techniques, Mathematical models, Flow, Unsaturated flow, Saturated flow, Steady flow.

Computer simulation of cross sectional models examined the variations in groundwater behavior in karstic terrains using a steady-state groundwater flow equation. This equation is capable of solving flow in unsaturated and saturated media and is thus suitable for karstic models. Adaptation to karstic models requires the consideration of directional permeability of the regolith, effects of point and diffuse discharge, and precipitation. Preliminary results illustrated the interrelationships between granular and solution-channel flow systems. Some of these results were: (1) granular flow patterns prevail as long as vertical permeability approximates horizontal permeability; and (2) topography plays an important role in concentrating pressure head drop along steep slopes. FLOW TO A WELL IN AN UNCONFINED FRACTURED AQUIFER,
Sheffield Univ. (England). Dept. of Civil and Structural Engineering.
N. S. Boulton, and T. D. Streltsova.
In: Hydrologic Problems in Karst Regions; Proceedings of Symposium held at Western Kentucky University, Bowling Green, Kentucky, April 26-29, 1976. Department of Geography and Geology, Western Kentucky University, Bowling Green, Kentucky, p 214-227, 1977. 8 fig, 4 ref.

Descriptors: *Aquifers, *Karsts, *Groundwater movement, *Model studies, *Drawdown, Fissures(Geologic), Flow, Pumping, Water levels, Groundwater, Theoretical analysis, Mathematical studies, Mathematical models, Analytical techniques, Equations, Wells, Water wells.

A new equation was derived for the fissure flow drawdown in a fractured aquifer under water table conditions. The abstraction well, which is pumped at a constant rate, is of full penetration. The fractured aquifer is assumed to consist of the block-and-fissure units. The compressibility of both the porous blocks and their adjoining fissures is taken into account. Flow in the blocks is assumed to be vertical, and flow in the fissures is horizontal. An equation for the flow in blocks was derived. A critical discussion of the theory for the flow of groundwater in fissured rocks was given. (See also W79-01932) (Humphreys-ISWS)
W79-01953

WATER WELL PRODUCTIVITY RELATED TO PHOTO-LINEAMENTS IN CARBONATES OF FREDERICK VALLEY, MARYLAND,
West Virginia Univ., Morgantown. Dept. of Geology and Geography.
M. P. LaRiccia, and H. W. Rauch.
In: Hydrologic Problems in Karst Regions; Proceedings of Symposium held at Western Kentucky University, Bowling Green, Kentucky, April 26-29, 1976. Department of Geography and Geology, Western Kentucky University, Bowling Green, Kentucky, p 228-234, 1977. 4 fig, 1 tab, 4 ref.

Descriptors: *Karst, *Aquifers, *Water yield, *Surveys, *Maryland, Hydrogeology, Groundwater, Water supply, Limestones, Water wells, Geology, Topography, Surfaces, Analysis, Areal hydrogeology, Specific capacity, Fissures(Geologic), *Frederick Valley(MD), Lineaments, Photo-lineaments.

The effect of photo-lineaments on water well productivity and drawdown was investigated for 65 domestic wells in the Grove and Frederick limestones of Frederick Valley in Frederick County, Maryland. Well information was obtained from Geological Survey data published by the Maryland Geological Survey, while photo-lineaments were mapped on both low altitude and high altitude black and white aerial photographs. Well productivity (both specific capacity and specific capacity index) was found to be significantly higher for pumped wells within 100 feet of a lineament compared with more distant wells, for both the Grove and Frederick limestones. For specific capacity, the near-lineament and off-lineament wells averaged 1.79 and 0.13 gallons per minute per foot of drawdown (gpm/ft), respectively, for the Frederick Limestone, while the Grove Limestone averaged 0.52 and 0.16 gpm/ft, respectively, for near-lineament and off-lineament wells. This indicates that at least short photo-lineaments are usually associated with higher transmissivities in underlying carbonate aquifers, within a zone at least 100 feet in width on either side of a lineament. Such lineaments, therefore, can be used as a prospecting tool for locating high capacity water wells in karst terrains. However, no significant differences in well productivity exist for near-lineament wells with respect to photo-lineament type (stream channel versus tonal-depression), well orientation near a lineament, and nearest lineament orientation. GROUNDWATER POTENTIAL OF THE KARST REGIONS OF ALBERTA, CANADA,
Research Council of Alberta, Edmonton.
G. Ozoray.
In: Hydrologic Problems in Karst Regions; Proceedings of Symposium held at Western Kentucky University, Bowling Green, Kentucky, April 26-29, 1976. Department of Geography and Geology, Western Kentucky University, Bowling Green, Kentucky, p 235-240, 1977. 1 fig, 23 ref.

Descriptors: *Karst, *Canada, *Groundwater potential, *Hydrogeology, Water supply, Aquifers, Limestones, Carbonate rocks, Geology, Water balance, *Alberta(Canada).

The mountain karst of the Cordilleran area (about 17,500 sq km) has a considerable karst water potential, by conservative estimation about 2 cu km annually. The quality of the water is excellent. Presently this potential is unused. Due to increasing demand, a substantial escalation in the use of karst waters is predicted for the near future. Systematic field observation, especially spring yield measurements, are needed to compute a water balance of the mountain karst area. The water of the Athabasca shallow buried karst and that of the deeply buried karst is chemically unsuitable for water supply, although it could be used for medical purposes and as industrial raw material. GROUND-WATER DEVELOPMENT PROBLEMS ASSOCIATED WITH FOLDED CARBONATE-ROCK AQUIFERS IN THE IRONDALE AREA, ALABAMA,
South Carolina Water Resources Commission, Columbia.
B. C. Springer, and S. L. Graves.
In: Hydrologic Problems in Karst Regions; Proceedings of Symposium held at Western Kentucky University, Bowling Green, Kentucky, April 26-29, 1976. Department of Geography and Geology, Western Kentucky University, Bowling Green, Kentucky, p 241-248, 1977. 3 fig, 8 ref.

Descriptors: *Water resources development, *Groundwater resources, *Karst, *Aquifers, *Alabama, Carbonate rocks, Water supply, Subsidence, Water pollution, Geology, Hydrogeology, Folds(Geologic), *Birmingham(Ala).

Carbonate rock aquifers of Paleozoic age are important sources of private, municipal, and industrial water supplies near Birmingham, Alabama. Aquifer contamination, subsidence, local over-development, and well-drilling difficulties are familiar problems associated with Appalachian Valley-type karst aquifers in this area of the folded Valley and Ridge. In and near the City of Irondale, a suburb of Birmingham, southeastward dipping carbonate rocks of Mississippian age supply the majority of groundwater to wells. In 1974, the Bangor Limestone, a shallow unconfined karst aquifer, was contaminated locally with heavy metals resulting in the pollution and abandonment of a municipal well at Irondale. However, a critical water shortage was avoided by the development of the Fort Payne-Tuscumbia, a deeper confined karst aquifer. Since 1969, the Fort Payne-Tuscumbia aquifer has been developed more widely in the Valley and Ridge of Alabama. High-yielded wells, such as the wells at Irondale, have been located and developed in the Fort Payne-Tuscumbia aquifer. The wells provide maximum possible protection against contamination and subsidence. Unfortunately, there are no rules for locating high-yielded wells in folded carbonate-rock aquifers. It is certain, how-

ever, that well-site selection must be a thorough process, and applicable to the local geohydrologic environment. (See also W79-01932) (Humphreys-ISWS)

HYDROGEOLOGY OF A CAVE UTILIZED FOR PUBLIC WATER SUPPLY: RIO CAMUY CAVE, PUERTO RICO, U.S.A.,
Georgia Dept. of Natural Resources, Atlanta. Earth and Water Div.
B. F. Beck.
In: Hydrologic Problems in Karst Regions; Proceedings of Symposium held at Western Kentucky University, Bowling Green, Kentucky, April 26-29, 1976. Department of Geography and Geology, Western Kentucky University, Bowling Green, Kentucky, p 249-261, 1977. 6 fig, 33 ref.

Descriptors: *Hydrogeology, *Puerto Rico, *Exploration, *Caves, On-site tests, Groundwater, Water supply, Geology, Karst, Hydrology, Climates, Analysis, Evaluation, Karst hydrology, Public water supply.

The Rio Camuy, one of Puerto Rico's major rivers, originates on the igneous terrain of the Central Mountains and flows north across the offlapping Tertiary limestones with their classic karst development. Where the river reaches the Lares Limestone, it sinks underground and flows through the Rio Camuy Cave System for 7 km, finally reappearing near the contact with the more marly Cibao Formation. Another tributary, a river in the Cueva de Los Angeles, joins the Rio Camuy underground. When measured, flow at the sinking point of the Camuy was 25 cu m/min, and the contribution from Cueva de Los Angeles was 22 cu m/min; but the total flow at the resurgence of the system was 92 cu m/min, indicating a major contribution from more diffuse recharge, or the existence of additional unknown trunk conduits. Portions of the cave are inaccessible, but dye tests and hydrochemical studies have demonstrated most of the connections. Within the karst terrain there is a major municipal water supply near the mouth of the Camuy (3,785 cu m/day) and another moderately large rural supply drawn from a well drilled into the Rio Camuy Cave System. This well is 152 m deep, with 35 cm slotted casing from 125 m to the bottom. It passes through the alluvium of the Rio Camuy within the cave and draws most of its flow from this source. Thus, because of its use for public water supply and because of the high pollution potential proven in karst aquifers, it is important that the details of the karst drainage to the Rio Camuy be accurately known to insure protection of this valuable water resource. CURRENT PROBLEMS IN THE RATIONAL EXPLOITATION OF KARST WATER,
Institute for Geological and Geophysical Research, Belgrade (Yugoslavia).
B. Mijatovic.
In: Hydrologic Problems in Karst Regions; Proceedings of Symposium held at Western Kentucky University, Bowling Green, Kentucky, April 26-29, 1976. Department of Geography and Geology, Western Kentucky University, Bowling Green, Kentucky, p 262-278, 1977. 9 fig, 4 ref

Descriptors: *Karst hydrology, *Groundwater potential, *Water supply, *Exploitation, Foreign research, Foreign countries, Aquifers, Groundwater, Springs, Discharge(Water), Groundwater resources, On-site investigations, Evaluation, Analytical techniques, Water resources development, *Yugoslavia.

The basic and most difficult problem in supplying water from karstic areas evolves from fluctuations in the quantity of water from large numbers of springs and other flows. This fact requires answers to the questions if an in what manner technical control measures to regulate flows of karstic water for more efficient exploitation can be used. Several Yugoslavian case studies were described, representing examples of circumstances favorable for the application of artificial improvements. Methods for increasing the volume of stored water and for controlling discharge, with better yields, involve such measures as dams, grout curtains, and drainage galleries. It was emphasized that extensive preliminary hydrogeological investigation is essential to the success of projected control measures. (See also W79-01932) (Humphreys-ISWS)

THE DEVELOPMENT AND MANAGEMENT OF KARST WATER RESOURCES IN THE CITY OF PECS AND ITS VICINITY, HUNGARY,
Vizugyi Igazgatosag, Pecs (Hungary).
K. Fekete.
In: Hydrologic Problems in Karst Regions; Proceedings of Symposium held at Western Kentucky University, Bowling Green, Kentucky, April 26-29, 1976. Department of Geography and Geology, Western Kentucky University, Boling Green, Kentucky, p 279-285, 1977. 7 ref.

Descriptors: *Karst, *Water resources development, *Water supply, *Groundwater, Springs, Caves, Discharge(Water), Management, Foreign countries, Foreign research, Water quality, *Hungary.

The rapidly growing city of Pecs, in southwest Hungary, obtains its water supply from several sources, including the high karst discussed in this paper. High Karst waters are relatively unpolluted and issue from springs in the hills above the city of Pecs and other communities. Two chief problems exist: the potential for pollution; and the wide fluctuation in discharge during the year. A theoretical model aimed at understanding and utilizing the hydrogeological system was attempted, but the model proved to be of limited usefulness. Trial dams were constructed for storing water inside the cave and fracture systems in hope of regulating discharges. The partial success in damming the systems, and problems with unexpected leakage were discussed. Use of a cave system as a natural pipeline was described. It was concluded that the high karst waters are well worthy of protection and utilization. Cave exploration, water tracing, and trial damming are necessary for further understanding of the systems. A dam at a proper site is needed for regulating the discharges. (See also W79-01932) (Humphreys-ISWS)

ARTIFICIAL WORKS AND EFFICIENT INTERCEPTION OF GROUNDWATER IN KARST,
Institute for Geological and Geophysical Research, Belgrade (Yugoslavia).
M. Komatina.
In: Hydrologic Problems in Karst Regions; Proceedings of Symposium held at Western Kentucky University, Bowling Green, Kentucky, April 26-29, 1976. Department of Geography and Geology, Western Kentucky University, Bowling Green Kentucky, p 286-296, 1977. 5 fig, 4 ref.

Descriptors: *Karst, *Groundwater, *Water supply, *Water control, Aquifers, Discharge(Water), Water yield, Hydraulic structures, Springs, Hydrogeology, Water quality, Interception, Foreign countries, Foreign research, *Yugoslavia.

An advanced knowledge of karst aquifers and the results of consolidation works in the region of surface reservoirs have suggested new possibilities for a greater utilization of karst water. This paper gave information about new ways in investigation and water interception for Dinaric karst and karst in general, based on artificial works. The known methods gave relatively low safe yield of groundwater, equalling the lowest discharge, while most of the water remained unused. The future concept of an economic groundwater production must be based on works aimed at a correction of natural conditions, above all a control of discharge. The concept of this problem's solution was considered in several examples of inland and coastal karst. Particular attention was given to Orebic and its vicinity, where many experiments and large-scale water-interception works were accomplished in the last 5 years, with notable results. EXPLORATION AND ENVIRONMENTAL INVESTIGATION OF THE PEACOCK SPRINGS CAVE SYSTEM,
Suwannee River Water Management District, FL.
D. W. Fisk, and I. S. Exley.
In: Hydrologic Problems in Karst Regions; Proceedings of Symposium held at Western Kentucky University, Bowling Greem, Kentucky, April 26-29, 1976. Department of Geography and Geology, Western Kentucky University, Bowling Green, Kentucky, p 297-302, 1977. 3 fig, 4 ref.

Descriptors: *Springs, *Caves, *Exploration, *Florida, *Karst, Water supply, Recharge, Hydrology, Aquifers, Limestones, Groundwater, Groundwater recharge, On-site investigations, Mapping, Hydrogeology, *Peacock Springs(Fla).

Field investigations at the Peacock Springs Cave System in west-central Suwannee County, Florida, revealed the development of an underwater cave system in response to geologic and hydrologic conditions. With over 15,100 feet of surveyed passage, the cave is one of the longest in the Southeast, and is the longest underwater cave surveyed in the United States. In the deeper sections of the cave, flow into the system provides large-scale recharge of the Floridan Aquifer, the main source of potable water in north Florida. Any future development near the springs would represent a threat to not only the integrity of the cave passages, but also to the local ground waters. (See also W79-01937) (Humphreys-ISWS)

ON THE MANAGEMENT OF KARST AQUIFERS IN SAUDI ARABIA,
North Carolina State Univ. at Raleigh. Dept. of Civil Engineering.
A-A. I. Kashef.
In: Hydrologic Problems in Karst Regions; Proceedings of Symposium held at Western Kentucky University, Bowling Green, Kentucky, April 26-29, 1976. Department of Geography and Geology, Western Kentucky University, Bowling Green, Kentucky, p 303-312, 1977. 2 fig, 23 ref.

Descriptors: *Karst, *Aquifers, *Water management(Applied), *Groundwater, Sandstones, Aquifer management, Saline water intrusion, Coasts, Springs, Water resources, Management, Water resources development, Foreign countries, *Saudi Arabia.

The coastal areas in eastern Saudi Arabia lie along the Arabian (Persian) Gulf, where sandstone aquifers are deeply buried or nonexistent. The shallow karst aquifers in these areas already have been extensively developed. The recent urbanization and expansion in industry and agriculture dictate the need to explore new water sources and to introduce sound management practices. The Gulf salt water has already intruded deeply in the coastal aquifers. Although a desalination plant is planned in this area, it is believed that, due to ecological factors, the 2 neglected major karst formations should be studied and developed. Furthermore, attention should be given to groundwater management which is not comprehended under the unique and complex political and socioeconomic structure. The paper summarized some of these problems as well as the current hydrologic conditions. Future water requirements were estimated. Conditions in karst regions in other countries were presented for guidance. Various comments were made to improve water resources management and to attract attention to the threatening degrees of salt water intrusion. (See also W79-01932) (Humphreys-ISWS)

HYDROLOGICAL PROBLEMS OF JUFRA WELL FIELD, LIBYA,
Ohio Univ., Athens. Dept. of Geology.

U. Ahmad.
Hydrologic Problems in Karst Regions; Proceedings of Symposium held at Western Kentucky versity, Bowling Green, Kentucky, April 26-1976. Department of Geography and Geology, stern Kentucky University, Bowling Green, ntucky, p 313-322, 1977. 7 fig, 8 ref.

scriptors: *Aquifers, *Groundwater resources, n-site tests, *Water supply, Hydrology, Karst, cific capacity, Deep wells, Water wells, Data lections, Hydrogeology, Geology, Test wells, alysis, Foreign countries, Foreign research, awdown, *Libya.

e Jufra area is located on the boundary of the -marine Fezzan Basin to the south, the Hamra in to the northwest, and the marine Sirte Basin the northeast. The main aquifer zone at Jufra sists of 45 meters of dolomitic limsetone. Eight ls have been drilled since 1961 near Socna, 15 20 kms northeast of Jufra project. In the Socna ality, the Misda aquifer is Upper Cretaceous estone at a depth of 150-200 meters. This lime-ne is intensely fractured along the Hun Graben der fault zone. Well capacities are variable and re produced by free flow only. Pressures up to atmospheres have been reported. Water com-ition is fairly uniform between 1300-1700 ppm l dissolved solids. In the Socna Town Hall ll, a maximum of 30 meters of drawdown is erved for a total pumpage of 80 million cu M of ter. Contractors for the Council of Agricultural velopment planned the Jufra Agricultural Proj-, a farm settlement plan by which 20 wells uld irrigate 3,000 hectares. The Misda aquifer uld produce 60 million cu M of water per year. e 9 wells drilled to date in the Jufra area have cific capacities 3.6 cu M/HM to 20 cu M/HM, indicate very high initial transmissivities of 0 sq M/D and storage coefficient of 0.000087. ne-drawdown graphs showed the effect of fauly ndaries which were located by air photo inter-tation. The other consultants have predicted the wdown after 50 years to be from 30 to 50 ters, ignoring the boundaries and leakage from deeper aquifer. An attempt to pump 68 million M per from the faultefd Misda aquifer may se serious drawdown in the future. (See also 9-01932) (Humphreys-ISWS)

MODEL FOR RELATING LAND USE AND OUNDWATER QUALITY IN SOUTHERN SSOURI,
ark Underground Lab., Protem, MO.
Aley.
Hydrologic Problems in Karst Regions; Proedings of Symposium held at Western Kentucky iversity, Bowling Green, Kentucky, April 26-1976. Department of Geography and Geology, estern Kentucky University, Bowling Green, ntucky, p 323-332, 1977. 5 tab, 6 ref.

scriptors: *Karst hydrology, *Model studies, issouri, *Groundwater, Discharge(Water), Base w, Water quality, Land use, Land management, oundwater recharge, Hydrogeology, On-site in-stigations, Sinks, Springs, Groundwater re-rces, *Missouri Ozarks.

hydrologic model was developed for relating oundwater recharge and groundwater discharge an 1,100 sq mi area in the southern Missouri arks. There are approximately 455,000 acre feet discrete recharge and 265,000 acre feet of dif-e recharge in the area per year. Mean annual nsit water discharge is approximately 200,000 re feet; mean annual storage water discharge is proximately 520,000 acre feet. The hydrologic odel permits land managers and land use planners recognize relative hazards to the groundwater ality of the area. (See also W79-01932) (Hum-reys-ISWS)

YDROLOGY OF KARST FEATURES IN EVA-ORITE DEPOSITS OF THE UPPER PER-IAN IN TEXAS,
eological Survey, Reston, VA. Water Resources Div.
R. C. Baker.
In: Hydrologic Problems in Karst Regions; Proceedings of Symposium held at Western Kentucky University, Bowling Green, Kentucky, April 26-29, 1976. Department of Geography and Geology, Western Kentucky University, Bowling Green, Kentucky, p 333-339, 1977. 4 fig, 7 ref.

Descriptors: *Karst hydrology, *Groundwater, *Texas, Springs, Caves, Saline water, Discharge(Water), Sinks, Hydrogeology, Aquifers, *Permian(Texas), Evaporites.

Rocks of Upper Permian age in west Texas consist largely of red beds, but with interbedded gypsum and salt mostly in the lower part. Water moves downward from the overlying Ogallala formation into the Upper Permian to layers of gypsum; and then by solution and making caves, moves eastward and is discharged at the outcrop area of the gypsum. The vertical movement of the water is facilitated by the collapse of the underlying red beds into the caves. An estimated 10 million kilograms (10,000 tons) of chloride per day is discharged into the Arkansas, Red, and Brazoa Rivers. An understanding of the karst hydrology producing the salt water might be of importance to projects for alleviating the natural contamination. (See also W79-01932) (Humphreys-ISWS)

2G. Water In Soils

TWO-DIMENSIONAL UNSTEADY WATER FLOW IN UNSATURATED POROUS MEDIA,
California Univ., Santa Barbara. Dept. of Mechanical and Environmental Engineering.
J. C. Bruch, Jr.
In: Finite Elements in Water Resources, Edited by Gray, Pinder and Brebbia, Pentech Press, 1977, p. 3.3 - 3.19. 4 fig, 21 ref. (California Water Resources Center Project UCAL-WRC-W-336). OWRT-A-039-CAL(17).

Descriptors: *Finite element analysis, *Unsteady flow, *Groundwater, *Porous media, Unsaturated flow.

Two-dimensional unsteady water flow in unsaturated porous media is a common occurrence in groundwater flow. A finite element weighted residual iteration scheme is presented to solve this type of problem for the water content in the soil. The method presented is general and the results are compared with another published numerical solution to a similar example. The uniqueness of the solution and error estimates for the successive substitution scheme are presented to complete the analysis of the problem. (Snyder-Calif, Davis)

TRANSIENT TWO-DIMENSIONAL PROBLEMS UTILIZING THE LEAST SQUARES ALGORITHM,
California Univ., Santa Barbara. Dept. of Mechanical and Environmental Engineering.
J. C. Bruch, Jr., and R. W. Lewis.
Journal of Heat Transfer, August 1975, p 467-469. 1 fig, 2 tab, 6 ref. (California Water Resources Center Projects UCAL-WRC-W-428) OWRT-A-039-CAL(13).

Descriptors: *Algorithms, *Least squares method, *Finite element analysis, Mathematical studies, Analytical techniques.

The least squares time-stepping algorith, which has previously been shown by the authors to be competitive for one-dimensional problems, is applied to the solution of several two-dimensional examples having constant material properties. The results are compared against answers obtained using recurrence relationships based on the finite element and finite difference methods. Analytical results for one of the examples are also used for comparison. The least squares algorithm proved to be more accurate for equal values of time step especially in the large time step cases. It, however, requires more computer time and storage than the other methods used. Several other limitations of the scheme are also presented. (Snyder-Calif, Davis)

A FINITE ELEMENT WEIGHTED RESIDUAL SOLUTION TO ONE-DIMENSIONAL FIELD PROBLEMS,
California Univ., Santa Barbara. Dept. of Mechanical and Environmental Engineering.
J. C. Bruch, and G. Zyvoloski.
International Journal of Numerical Methods in Engineering, Vol. 6, 1973, p. 577-585. 2 fig, 7 tab, 9 ref. (California Water Resources Center Project, UCAL-WRC-W-336). OWRT-A-039-CAL(5).

Descriptors: *Finite difference method, Mathematical analysis, Numerical analysis, *Unsaturated flow, *Porous media, *Finite element analysis.

The one-dimensional diffusion-convection equation if formulated with the finite element representation employing the galerkin approach. A linear shape function and two-dimensional triangular and rectangular elements in space and time were used in solving the problem. The results are compared with finite difference solutions as well as the exact solution. As another example, the convection term is set equal to zero and these techniques are applied to the resulting heat equation and similar comparisons are made. (Snyder-Calif, Davis)
W79-01558

A FINITE ELEMENT SOLUTION TO A GENERAL TWO-DIMENSIONAL NONSYMMETRIC PARABOLIC PARTIAL DIFFERENTIAL EQUATION,
California Univ., Santa Barbara. Dept. of Mechanical and Environmental Engineering.
J. C. Bruch, and G. Zyvoloski.
Computers and Fluids, Vol. 3, p. 217-224. 1975, 4 fig, 9 ref. (California Water Resources Center Project UCAL-WRC-W-336). OWRT A-039-CAL(11).

Descriptors: *Finite element analysis, *Mathematical studies, Analytical techniques, *Differential equations, *Galerkin method.

A general solution for a two-dimensional nonsymmetric parabolic partial differential equation is obtained using the Galerkin method in which the weighting function is taken equal to the shape function defining the dependent variable approximation. The solution domain was divided into finite elements having space-time coordinates. The solution technique was applied to the motion of dissolved constitutents in groundwater flow. The results are compared with the analytical and a finite-difference solution to the same problem. The finite element results compared extremely well with the analytical solution and did not display the numerical dispersion problems that occur in the finite difference solution. (Snyder-Calif, Davis)

FINITE ELEMENT SOLUTION OF TWO-DIMENSIONAL UNSTEADY AND UNSATURATED FLOW IN POROUS MEDIA.
California Univ., Santa Barbara. Dept. of Mechanical and Environmental Engineering.
G. Zyvoloski, and J. C. Bruch, Jr.
In: The Mathematics of Finite Elements and Applications II, edited by J.R. Whiteman, Academic Press, 1976, p. 299-307. 3 fig, 14 ref. (California Water Resources Center Project UCAL--WRC-W-336). OWRT A-039-CAL(16).

Descriptors: *Unsteady flow, *Groundwater, *Porous media, *Finite element analysis, Unsaturated flow.

A finite element weighted residual, successive substitution solution method is given for two-dimensional unsteady and unsaturated flows in porous media. For this type of flow problem, not only the governing differential equation, but also some of the boundary conditions are nonlinear. The technique presented is very general and easy to apply. Within each time step the solution subject to a fixed errors criterion which can be varied from step to step converges quite rapidly. As was seen the nonlinear heat conduction problem was a special case of the general mathematical model and theory. (Snyder-Calif, Davis)

THE USE OF NONIONIC SURFACTANTS ON SOILS,
California Univ., Riverside. Dept. of Soil Science and Agricultural Engineering.
J. Letey.
In: Soil Conditioners, 1975, Soil Science Society of America, p 145-154. 5 fig, 1 tab, 17 ref. (California Water Resources Center Project UCAL-WRC-W-332). OWRT B-141-CAL(12).

Descriptors: *Surfactants, *Soil water, *Wettability, Plant growth, Penetration, Surface tension, Absorption, *Infiltration rates, Application rates, Plant growth.

Nonionic surfactants lower the surface tension of water and are adsorbed by soil materials. Surfactants can be used to increase infiltration rates of water repellent soils but have not been demonstrated to be effective in increasing infiltration rates of wettable soils. Aggregate stability can be decreased, increased, and unaffected by nonionic surfactant treatment depending upon the surfactant application rate and nature of the soil being treated. Soil modulus of rupture can be decreased by very high surfactant application rates. Relatively low surfactant concentrations detrimentally affect plant growth in solution culture. Only extremely high application rates on soils detrimentally affect plant growth. Plants growing in water-repellent materials can be beneficially affected by surfactant application which improve the soil-water status for plants.

ALTERNATE DRYING AND REWETTING EFFECTS ON CHEMICAL AND PHYSICAL PROPERTIES AND MOISTURE-SALINITY RELATIONSHIPS OF A HISTOSOL,
Volcani Inst. of Agricultural Research, Bet-Dagan (Israel).
M. Giskin, and I. Levin.
Agronomy Journal, Vol. 70, No. 3, p 445-447, May-June, 1978. 1 fig, 2 tab, 19 ref.

Descriptors: *Organic soils, *Drying, *Wetting, *Soil management, Soil chemical properties, Soil physical properties, Moisture content, *Electrical conductance, *Irrigation, *Histosols, *Saline soils, Salinity.

The purpose of the study was to investigate the possible influences on soil management of changes in chemical and physical properties resulting from a Histosol being carried through several successive dryings and wettings. Soil from the 0 to 30 cm layer of a low moor Histosol with a pH of 7.6 and organic matter content of 55.3% was used. Th soil was put through three successive cycle of ai drying and rewetting; subsamples were removed each stage and physical and chemical determin tions were carried out. The saturation percentag of the field sample decreased from 95.9 to 87.3 after the third drying cycle. The electrical condu tivity of the saturation extract decreased at eac drying stage, due to the large differences in th nitrate content between the dry and wet stages vs. 380 ppm). Moisture retention curve da showed a 5% difference in available water b tween the moist field sample and the same samp after air-drying. The data showed that laborator measurements of soil-water relations for a Histos change with time, i.e., with each exposure drying and rewetting prior to sampling. This info mation will have a direct bearing on the manag ment of a Histosol. (Skogerboe-Colorado Stat W79-01699

LINEARIZED MOISTURE FLOW WITH LOS AT THE SOIL SURFACE,
Arizona Univ. Tucson. Dept. of Soils, Water an Engineering.
D. O. Lomen, and A. W. Warrick.
Soil Science Society of America Journal, Vol 4 No. 3 p 396-399, May-June, 1978. 2 fig, 8 re

Descriptors: *Soil water movement, Unsaturate flow, Evaporation, *Moisture content.

The general solution of a linearized moisture flo equation is derived for point and line source whether buried or on the soil surface. The surfac flux is taken to be proportional to the matric flu potential, which is consistent with the physic situation of small evaporative losses for dry so and larger losses for wet soil. The fraction of wate lost at the surface turns out to be identical for poi and line sources and for the steady-state case (m(2+m)) exponent (-alpha d) where m is th surface flux proportionality constant, d the dept of source, and alpha a constant from the assume unsaturated hydraulic conductivity function. Thi fraction is plotted as a function of time for a fixe source depth. Also given are curves depicting th total water loss as a function of source depth. generalized solution is derived for any type source located in a horizontal plane. (Skogerbo Colorado State)

NITRAPYRIN DEGRADATION AND MOVE MENT IN SOIL,
Georgia Univ., Experiment. Dept. of Agronomy
J. T. Touchton, R. G. Hoeft, and L. F. Welch.
Agronomy Journal, Vol. 70, No. 5, p 811-816 September-October, 1978. 5 fig, 5 tab, 13 ref.

Descriptors: *Nitrogen, *Nitrapyrin, *Nitrifica tion, Inhibitors, Degradation(Decomposition) *Ammonium compounds, Ammonia, *Fertilizers Soil chemical properties, Soil chemical properties Soil physical properties.

Nitrapyrin (2-chloro-6-(trichloromethyl) pyridine is applied with ammonium-N fertilizers to contro nitrification in soil. However, little information available on the the persistence or loss of field applied nitrapyrin. The objective of this study wa to monitor movement and degradation of nitra pyrin in soil. Nitrapyrin was applied with anhy drous ammonia in the fall of 1975 and spring o 1975 and 1976. Measurable quatities of nitrapyri were not found beyond 7.5 cm from the point o release in the soil. The instance that nitrapyri moved from the point of release in the soil was no affected by nitrapyrin rates. Greater nitrpyri movement was not detected in one direction from the point of release in the soil than in another direction. Increasing rates of anhydrous ammoni had no effect on nitrapyrin movement of degrada tion. The most rapid rate of degradation occurred soon after application and decreased with time The data suggest that nitrapyrin degradation and movement will depend on the physical and chemi cal characteristics of the soil. Even though degra dation rates decreased with time, no indication wa found to prove that soil accumulations of nitra

rin will result from once-a-year applications.

N ANALYSIS OF SENSIBLE AND LATENT EAT FLOW IN A PARTIALLY FROZEN UNATURATED SOIL,
'ashington State Univ., Pullman. Dept. of Agronny and Soils.
. Fuchs, G. S. Campbell, and R. I. Papendick.
oil Science Society of America Journal, Vol. 42, o. 3, p 379-385, May-June, 1978. 5 fig, 2 tab, 15 f, 2 append.

escriptors: *Frozen soils, *Heat flow, Freezing, hawing, Solutes, *Latent heat, Thermal conducvity.

heat flow theory has been developed which can e used to predict freezing and thawing cycles of a mperate soil. The latent heat of fusion is incorpoated into the classical heat flow equation with the eat capacity and the thermal conductivity of the oil modified to include terms which account for he phase transformation. Computations for a Pause silt loam soil show that the ice-liquid phase ansformation occurs over a defined temperature nge where the apparent heat capacity and the pparent thermal conductivity may take on values hich are several orders of magnitude larger than ose either in the unfrozen or in the near completely frozen soil. The computations also indicate at the presence of solutes in the soil water signifiantly lowers the temperature range over which he freeze-thaw zone develops and may allow conderable transport of water and heat at lower emperatures than in the absence of solutes. ROP WATER REQUIREMENT IN RELATION O CLIMATE AND SOIL,
olcani Inst. of Agricultural Research, Bet-Dagan Israel). Inst. of Soils and Water.
. Shalhevet, and H. Bielorai.
oil Science, Vol. 125, No. 4, p 240-247, April, 978. 2 fig, 4 tab, 22 ref.

Descriptors: *Water requirements, Yield equation, Climatic data, *Soil properties, Cotton, Sorghum, Grapefruit, Evapotranspiration, Evaporation, Pans, Correlation analysis.

The effect of variation in climate and soil on the roduction function of water for the yield of otton, sorghum, and grapefruit was analyzed to etermine the transferability of water requirement nformation, accumulated in Israel, to other reions of the world. A model giving relative yield Y) as a linear function of relative evapotranspiraion (Et/Eo) for all climatic regions together was ompared with regional relationships of Y to net vater application. Y is the ratio of a treatment ield to the maximum yield obtained in an experiment; Et and EO are the cumulative seasonal evaotranspiration, including a small drainage compoent, and pan evaporation, respectively. The correation coefficients were high for field crops but maller for citrus. About 90 percent of the variabilty in yield of field crops were attributed to differnces in potential evapotranspiration and in irrigaion amounts. No effect was found of variations in oil on crop yield due to the rather uniform waterstorage capacity of soils of varying texture. It was roposed that the production functions obtained in Israel may be used in regions with similar climatic characteristics for a wide range of soils after accounting for climatic variations through pan evaporation estimates. FERTILIZATION DECISION MODEL-A SYNTHESIS OF SOIL AND PLANT PARAMETERS IN A COMPUTERIZED PROGRAM,
Volcani Inst. of Agricultural Research, Bet-Dagan (Israel). Inst. of Soils and Water.
U. Kafkafi, B. Bar-Yosef, and A. Hadas.
Soil Science, Vol. 125, No. 4, p 261-268, April, 1978. 1 fig, 2 tab, 43 ref, 3 append.

Descriptors: *Fertilization, *Computer models, Plant growth, Nitrates, Nitrogen, Phosphates, Potassium, Ammonium compounds, Nutrient removal, Root development, *Model studies, *Computer programs.

A fertilization decision model was suggested, based on soil and plant parameters. The optimum concentration range of nitrate nitrogen in the soil solution, during the uptake period of the growing plant, was suggested to be 50 to 250 ppm N-NO3 for all soils and plants. The optimum bicarbonate-soluble P was found to vary with plant and soil type, and was determined by response experiments. Percent recovery of added fertilizer by bicarbonate extraction was used to calculate the amount of fertilizer needed to raise the extraction value to the optimum level. Exchangeable potassium was considered to be the only source important during the growing season of an annual crop. The uptake rate of nutrients during the growing season, depth the root penetration, and sensitivity to ammonium were considered to be the main plant parameters. The model calculates, at present time intervals, the balance between the quantity of nutrients in the root zone and uptake by plants. A decision to add fertilizer is made if a deviation from the optimum exceeds a predetermined value. (Skogerboe-Colorado State)

Descriptors: *Nitrification, Inhibitors, Denitrification, *Nitrates, Fertilizers, *Ammonia fertilizers, Leaching, Timing, Rates of application, Soil types, *Nitrapyrin, *Nitrogen.

Nitrification of ammonium fertilizers in late fall and early spring and subsequent nitrate losses through leaching and denitrification are a continuing economical and environmental concern. To evaluate the effects of nitrapyrin on nitrification, anhydrous ammonia with and without nitrapyrin was applied in the fall and spring to poorly drained soils. Nitrogen and nitrapyrin rates ranged from 0 to 268 and 0 to 1.12 kg/ha, respectively. Detailed sampling from ammonia retention zones was conducted throughout the fall, spring, and summer. Effects of nitrapyrin on nitrification varied with time of application, nitrapyrin rate, and soil type. (Skogerboe-Colorado State)

THE STATISTICAL MECHANICAL THEORY OF WATER TRANSPORT THROUGH UNSATURATED SOIL. 1. THE CONSERVATION LAWS,
California Univ., Riverside. Dept. of Soil and Environmental Sciences.
G. Sposito.
Water Resources Research, Vol. 14, No. 3, p 474-478, June 1978. 26 ref. OWRT B-046-ARIZ(8), NSF ENG76-0921.

Descriptors: *Soil water movement, *Theoretical analysis, *Statistical models, *Unsaturated flow, Equations, Statistical methods, Mass, Momentum equation, Continuity equation, Mathematical models, Model studies, *Statistical mechanics, Macroscopic balance equations.

The macroscopic differential equations of mass and momentum balance for water in a rigid unsaturated soil were derived from first principles by using the methods of statistical mechanics. The derivation begins with the development, at the molecular level, of expressions for the mass and linear momentum densities of water in a soil. The derivatives of these expressions with respect to the time then provide for local balance equations that are ensemble averaged and local volume averaged in order to produce the macroscopic balance equations. The resulting macroscopic equations agreed with those derived for mass and linear momentum transport in a soil on the basis of the continuum theory of mixtures. The unified insight into mass transport processes afforded by a statistical mechanical theory as compared to one evolved from a solely macorscopic view was discussed. THE STATISTICAL MECHANICAL THEORY OF WATER TRANSPORT THROUGH UNSATURATED SOIL. 2. DERIVATION OF THE BUCKINGHAM-DARCY FLUX LAW,
California Univ., Riverside. Dept. of Soil and Environmental Sciences.
G. Sposito.
Water Resources Research, Vol. 14, No. 3, p 479-484, June 1978. 18 ref. ENG76-09210.

Descriptors: *Soil water movement, *Theoretical analysis, *Statistical models, *Unsaturated flow, Equations, Hydraulic conductivity, Statistical methods, Hydraulic gradient, Mathematical studies, Buckingham-Darcy flux law, Experiments, Linear response theory.

The Buckingham-Darcy flux law, an empirical equation that relates the volumetric flux density of water in an unsaturated soil to the gradient of the total potential, was derived from first principles by using the methods of statistical mechanics. The derivation given, a direct application of well-known techniques in nonequilibrium statistical mechanics, proceeds through a detailed molecular description of two laboratory experiments for measuring the hydraulic conductivity tensor of a homogeneous unsaturated soil. In the first experi-

ment, the steady flow of water is induced by a gradient in the matric potential; while in the second, flow is induced by a gradient in the gravitational potential. In both cases, the appropriate form of the Buckingham-Darcy law was derived on the basis of a linear response approximation, and an expression for the hydraulic conductivity was given in terms of a time integral of the correlation function for the velocities of the water molecules in the soil. The problem of calculating the hydraulic conductivity of soil thereby was reduced to quadrature and to the task of developing a molecular model of the velocity correlation among the water molecules. A recent successful model of this type was discussed briefly. (See also W79-01724) (Visocky-ISWS)

H. M. Selim.
Soil Science, Vol. 126, No. 3, p 127-135, September, 1978. 10 fig, 14 ref.

Descriptors: *Solutes, *Unsaturated flow, *Soil water movement, *Mass transfer, Mathematical models, Numerical analysis, Equations, Infiltration, Adsorption, Chemical reactions, Unsteady flow, Model studies, Multilayered soils, Redistribution.

A numerical model was developed to predict water and reactive solute transport through water-unsaturated, mulitlayered soils. An explicit-implicit finite difference approximation method was used to solve the water and solute transport equations simultaneously. Calculated results were presented for two- and three-layered soils during water infiltration and redistribution. Linear and nonlinear equilibrium adsorption, first-order kinetic reaction, and irrversible kinetic reaction were used to describe solute adsorption in individual soil layers. It was found that, for all adsorption mechanisms considered, concentration distributions during infiltration and redistribution was influenced significantly by the order in which the soil layers were stratified. Chemical studies of Lake Powell indicated that its waters are moderately saline and that their composition is controlled by the relative proportions of contributions from the Green, San Juan, and Colorado Rivers. Ionic species are present in the proportions SO4 more than Ca similar to Na more than Alkalinity more than Mg more than Cl much more than K. Surface waters are oversaturated with respect to calcium carbonate, and salt flux calculations and comparisons of pre-and post-dam bicarbonate concentrations of river water at Lee's Ferry suggested precipitation of calcium carbonate in Lake Powell. Physical studies of the lake showed that it can be classified as warm monomictic; but it possesses meromictic tendencies inasmuch as convective mixing to the bottom does not occur. Despite the lack of deep convective mixing, the bottom waters have not become anaerobic because they are replaced periodically by cold, saline, advective flows from the input at Hite. The lake still possesses much of the character of a river reach in which the water has a long residence time. (Henley-ISWS)

Descriptors: *Chemistry of lakes, *Land use, Soils, Lake basins, Eutrophication, Water pollution effects, *Zoning, *Drainage basin analysis(Lakes), *Connecticut, Lakes, Planning models.

Land use, soils, and lake water chemistry were studied in 12 lake drainage basins in stern Connecticut. Housing and agriculture are the most prevalent uses of land in the lake watersheds; However, the percentage of use varies substantially. Soil studies were based on Natural Soils Groups which also varied from basin to basin. In general, the most adaptable land for urban development has been the first used for residential subdivision. Further residential intensification, especially on hardpan soils, could become a major factor in eutrophication acceleration and water pollution. The relationship of land use and soils to water chemistry is complex and must consider regional differences in waters prior to examination for change. Eastern Connecticut lakes are mostly soft ad extremely soft

ith respect to bicarbonate content. Specific conductivities of lake water range from 34 to 154.4, ith a mean median of 62f micromhos/cm. for 76 kes sampled. An approximation of total dissolved lids in p.p.m. or mg/1 can be made by multiplyg specific conductance by 0.63. Major cation and ion dominance vary. 'Original' water dominated calcium and bicarbonate ions has been changed ainly by addition of sodium and chloride ions. 79-01589

V. J. Chapman, and J. Clayton.
Hydrobiologia, Vol. 47, No. 3-4, p 399-413, December 1, 1975. 3 fig, 1 ref.

Descriptors: *Submerged plants, *Lakes, *Survey, Rooted aquatic plants, Wetlands, Eutrophication, Light penetration, Plant morphology, Lake Rerewhakaiitu(New Zealand).

The submerged and emergent aquatic macrophyte vegetation of the eutrophic Lake Rerewhakaiitu was surveyed in February-March 1973, and is described qualitatively. At the time the lowered lake level had resulted in producing a sward of normally submerged aquatics as land forms. The principal dominant in the sward is Myriophyllum propinquun, the plants being greatly reduced in length to short stems with single entire leaves. At the uppermost levels Tillaea sinclairii is a significant component of the sward, and at lower levels Lilaeopsis lacustris behaves similarly. Below the uppermost submerged belt of macrophytes there is a characean meadow of Chara fibrosa and C. australis which in deeper waters gives way to Potamogeton ochreatus with either C. australis or Nitella hookeri. The high degree of eutrophication and consequent low light penetration has resulted in a vegetation limit at 4-5-5m, which is lower than that found in other Rotorua lakes. Illinois State Water Survey, Urbana. Hydrology Section.
N. G. Bhowmik.
Water Resources Bulletin, Vol. 14, No. 5, p 1064-1079, October 1978. 8 fig, 1 tab, 17 ref.

Descriptors: *Illinois, *Bank stabilization, *Shores, *Lakes, Erosion, Design, Boating, Filters, Gravels, Riprap, Lake shores, Waves(Water), Winds, Hydrology, Hydraulics, *Lake shore protection, Riprap particles.

A method was reported for estimating the height of wind waves in any lake for a given wind condition. Maximum wind speeds from 5 climatological stations in and around Illinois for the period of 1950-1972 were analyzed, and the maximum wind speed for various durations and return periods were presented. Statistical analysis of wind wave data collected from Carlyle Lake indicated that Rayleigh distribution fitted the wave height distribution reasonably well and that the nondimensional energy spectra followed the (f/f sub m) to the minus 5th power rule in the equilibrium range of frequencies. From a consideration of various forces and physical properties of riprap particles and water, a relationship was developed to estimate the stable weight of riprap particles. Practical design criteria wee proposed to stabilize lake shores against wind waves. (Lee-ISWS)

2I. Water In Plants

UPTAKE AND TRANSLOCATION OF A NONIONIC SURFACTANT BY BARLEY,
California Univ., Riverside. Dept. of Soil Science and Agricultural Engineering.
N. Valoras, J. Letey, and J. Osborn.
Agronomy Journal, Vol. 66, May-June 1974, p. 436-438. 6 fig, 1 tab, 7 ref. (California Water Resources Center Project UCAL-WRC-W-332). OWRT-B-141-CAL(10) and B-072-CAL(12).

Descriptors: *Wetting agents, Water repellency, Radioactive assays, *Surfactants(Nonionic), *Barley, *Absorption, *Plant growth.

Experiments were conducted to determine if nonionic surfactants are taken up and translocated by plants growing in solution or soil containing the surfactant. The effect of surfactant on plant growth was concurrently determined. Barley (Hordeum vulgare L.) and the surfactant 14C-labeled Soil Penetrant 3685 were used in the study. Surfactant concentrations in solution ranged from 0 to 300 ppm, and the amount of 14C-labeled surfactant measured in plant shoots increased as the solution concentration increased. There was also a decrease in plant growth as surfactant concentration application increased. Soils were wet with solutions containing 0 to 10,000 ppm surfactant. Surfactant was taken up and translocated from soil systems, but much higher concentrations had to be applied to the soil as compared to solution culture for equal uptake and/or plant damage. Highest concentrations of surfactant occurred in the older leaves and in the tip portion as compared to the base portion of the leaf. Increased plant damage appeared to be associated with increased surfactant concentration in the plant tissue, but a direct cause-and-effect relation could not be established from the study. (Snyder-Calif, Davis)

NONIONIC SURFACTANT EFFECTS ON GROWTH AND POROSITY OF BARLEY ROOTS,
California Univ., Riverside. Dept. of Soil Science and Agricultural Engineering.
R. J. Luxmoore, N. Valoras, and J. Letey.
Agronomy Journal, Vol. 65, Sept.-Oct. 1974, p. 673-675. 2 tab, 12 ref. (California Water Resources Center Project UCAL-WRC-W-332). OWRT B-141-CAL(11).

Descriptors: *Water repellency, *Surfactants, *Intercellular spaces, Porosity, *Root, *Barley, Growth rates.

Nonionic surfactant materials were applied in both solution and soil culture to assess the direct surfactant and the soil-surfactant interaction effects on root dry weight and root porosity (gas space volume per unit root volume) of barley (Hordeum vulgare L.). Plants were grown for 28 days in solution culture with nonionic surfactant Soil Penetrant 3685 up to 100 ppm. Root dry weight was significantly reduced at 40 ppm and was further reduced to 32% of control plant root weight at 100 ppm. Root porosity, determined by the pycnometer method decreased from 13% (control) to 9% with 20 to 80 ppm surfactant. At 100 ppm, porosity was 4.5%. These results suggest that surfactant penetrated the root at concentrations above 20 ppm and caused flooding of intercellular gas spaces. At a high concentrations above 20 ppm and caused flooding of intercellular gas spaces. At a high concentration (> 40 ppm) root growth decreased and the surfactant inhibited root tip meristematic processes. Soil Penetrant was more toxic to roots than water in surfactant and this more toxic than Aqua Gro surfactant in a soil having little water repellency. Adsorption of surfactants by soil reduced the toxicity to roots. In a water repellent soil, root growth at 28 days was greatly enhanced with a 5,000 ppm addition of either Aqua Gro or Water In indicating more favorable soil-plant water relations. In both soils root dry weight was reduced at high surfactant concentration, however, there were no significant effects on root porosity (mean value 5.7%) suggesting that root tip physiology was more affected by surfactants than internal root morphology. DISTRIBUTION AND PRODUCTION OF SAGO PONDWEED (POTAMOGETON PECTINATUS L.) ON A NORTHERN PRAIRIE MARSH,
Delta Waterfowl Research Station, Portage la Prairie (Manitoba).
M. G. Anderson.
Ecology, Vol. 59, No. 1, p 154-160, Winter, 1978. 1 fig, 2 tab, 54 ref.

Descriptors: *Pondweeds, *Potamogeton species, *Ecological distribution, *Standing crops, Soils, Soil texture, Marshes, Phosphorus, Potassium, Fresh water marshes, Rooted aquatic plants, Delta Marsh(Manitoba), Canada, Lake Manitoba.

Physical and chemical parameters of soils and water, measured on 140 sites in the Delta Marsh, Manitoba between May 1973 and September 1974, were compared with presence and dry-weight standing crop of sago pondweed (Potamogeton pectinatus L.) on those sites. Mean comparisons and discriminant function analyses identified water depth, soil texture and maximum and directional exposure to wave action as important variable affecting plant distribution. Multiple regression analyses suggested that water depth, available soil K, available soil P, soil texture and directional exposure, were important factors affecting growth on colonized sites. A greenhouse experiment demonstrated that sago pondweed grew better on Delta Marsh soils that normally supported the plant, suggesting that some specific edaphic adaptations might exist. Within the euphotic zone of the Delta Marsh, sago pondweed distribution was probably most affected by predvailing winds through their influence on soil distribution and turbulence. (Stihler-Mass)

Descriptors: *Salt marshes, Marsh plants, *Spoil banks, *Vegetation establishment, *Planting management, Wetlands, Marshes, Halophytes, Coastal engineering, Excavation, Dredging, Grasses, Marsh management, Soil types, Soil properties, Elevation, Salt marsh establishment, Dredge spoil salt marsh, Spartina alterniflora.

Both seeding and transplating have resulted in successful artificial marsh establishment on natural coastal areas and on deposited dredged materials. Establishment appears to be independent of substrate, but long-term growth and survival of salt marsh grasses apparently are dependent upon substrate. Growth regulation appears to be associated with soil physical factors such as percolation, diffusion, drainage, and aeration rather than with the chemical characteristics of the soil. Elevation and hydraulics, which largely determine the periodicity of plat submergence and emergence, appear to control plat distribution and zonation. Since momentum transport is also largely determined by elevation and hydraulics, establishment and growth of salt marsh plants are affected by the bed sheer stress of the substrate. Biological, mechanical, and engineering problems associated with artificial marsh establishment are discussed. Consideration of these problems and the rapid process of natural invasion and colonization of salt marsh plants on properly elevated dredged materials has resulted in the conclusion that emphasis should be placed on the development of equipment and techniques to allow fine control of dredged material elevation. Ponded and streamside wetland systems along the eastern shoreline of Lake Ontario have compositional similarities but distinctive productivity, diversity, and zonation patterns. Long-term compositional changes in ponded and streamside wetland systems occur in response to changes in the environmental complex, especially those involving water regime, nutrient enrichment, and the introduction of competitive species. Short-term changes are more readily interpretated as a response to disturbance and are often temporary. Physiognomic zonation is evident among wetland communi-

ties but compositional zonation is present only among steep environmental gradients. Net annual primary production increases as substrate nutrient supply increases, providing the improvement has not resulted from disturbance like detrital movements. A negative relationship exists between net annual primary productivity and diversity suggesting that increases in community complexity comes at the expense of lower primary production. Possible mechanisms that might account for this consistent relationship include temporal spacing of species productivities in the more diverse communities, vegetative stratification, and the role of woody individuals. PRELIMINARY GUIDE TO WETLANDS OF THE WEST COAST STATES; MAJOR ASSOCIATIONS AND COMMUNITIES IDENTIFIED.
Army Engineer Waterways Experiment Station, Vicksburg, MS.
Available from the National Technical Information Service, Springfield, VA 22161 as ADA-055 106, Price codes: A05 in paper copy, A01 in microfiche. Technical Report Y-78-4, April 1978. 95 p, 3 append, 13 fig, 62 ref. Prepared in Environmental Laboratory, USAEWES.

Descriptors: *Wetlands, *Plant populations, *Vegetation, *West Coast states(US).

This guide to the major plant associations and communities found in wetlands within the West Coast States is one of a series of eight such guides, each prepared by a specialist or specialists familiar with the wetlands in the region covered by the guide. The guides are intended for distribution to the various U.S. Army Engineer Districts for use in wetland identification in the implementation of Section 404 of the Federal Water Pollution Control Act Amendments of 1972. The classification system in the guide is intended solely for use in the Section 404 permit program and is not considered a classification system for other purposes. (WES)

F. N. Dalton, and W. R. Gardner.
Agronomy Journal, Vol. 70, No. 3, p 404-406, May-June, 1978. 4 fig, 1 tab, 11 ref.

Descriptors: *Moisture uptake, *Root systems, *Temperature, Solutes, Kinetics, Diffusivity, *Absorption.

The Transport of water through root membranes is described in terms of equations which couple water and solute transport. The solute transport equatin includes active as well as passive uptake. Temperature effects are manifested in the viscosity of water, the osmotic permeability coefficient of the membranes, and the rate constant for the active solute uptake. From standard reaction rate kinetics, reasonable estimates of of the termperature coefficients of these three processes can be made. A genral equation for the effect of temperature on the uptake rate for a given driving force is derived. This difference in flux between live and dead roots is adequately described by the model, indicating the significance of the active component of the uptake process. (Skogerboe-Colorado State)

FLUVIAL ADJUSTMENTS TO THE SPREAD OF TAMARISK IN THE COLORADO PLATEAU REGION,
Iowa Univ., Iowa City. Dept. of Geography.
W. L. Graf.
Geological Society of America Bulletin, Vol. 89, No. 10, p 1491-1501, October 1978. 13 fig, 4 tab, 42 ref.

Descriptors: *Shrubs, *Colorado, *Tamarisk, Fluvial sediments, Sedimentation, Flooding, Turbulence, Friction, Islands, Sand bars, Vegetation effects.

Tamarisk, a shrub or low tree that was artificially introduced into the American Southwest in the late 1800's, has spread throughout the Colorado Plateau region by occupying islands, sand bars, and beaches along streams. Historical photographs show that tamarisk spread from northern Arizona to the upper reaches of the Colorado and Green Rivers at a rate of about 20 km/yr. Detailed studies on the Green River in Canyonlands National Park, Utah, showed that the plant has trapped and stabilized sediment, causing an average reduction in channel width of 27%. Photogrammetric analysis of historical ground photography, including photos from John Wesley Powell's 1871 expedition, and recent aerial photographs supplemented by field surveys provided quantitative data. Expanded islands and channel-side bars exhibit allometric relationships as they change, apparently maintaining a balance between turbulence and friction. Overbank flooding is common on the tamarisk-stabilized features. (Lee-ISWS)

SEASONAL VARIATION IN BEACH EROSION AND SEDIMENTATION ON THE OREGON COAST,
Williams Coll., Williamstown, MA. Dept. of Geology.
W. T. Fox, and R. A. Davis, Jr.
Geological Society of America Bulletin, Vol. 89, No. 10, p 1541-1549, October 1978. 13 fig, 1 tab, 23 ref.

Descriptors: *Beach erosion, *Sedimentation, *Oregon, *Seasonal, Waves(Water), Sands, Winter, Summer, Winds, Climates, *Beach profiles, Summer upwelling season, Winter storm season, Barometric pressure.

A study of the relationship between climate and beach erosion was conducted on the Oregon coast from June 1973 through May 1974. The climatic year on the Oregon coast can be divided into 2 major seasons, the summer upwelling season, extending from early April through late September; and the winter storm season, from October through March. The summer upwelling season, dominated by the North Pacific high, is characterized by north winds, coastal upwelling, frequent fog, and low waves. The winter storm season is marked by strong winds, heavy rain, and high waves. During the upwelling season, north winds were 0 to 15 m/s, and waves were 1 to 3 m high. Two sets of sand bars formed in the intertidal zne, advanced up the beach at 1 to 5 m/day, and expanded to the south at 5 to 15 m/day. Topographic maps of the beach and intertidal zone were surveyed at low spring tides at South Beach, Oregon. There was a net deposition of 15,100 cu m of sand on the beach from July 4 through August 12, 1973. In the winter storm season, the wind shifted to the southwest, increased to 22 m/s, and waves reached more than 5 m in height. Sand was stripped from the beach by longshore currents and backwash from waves during storms and returned to the beach in large bars between storms. The total volume of sand involved in the exchange was about 54,000 cu m or 110 cu m per linear meter of beach. (Lee-ISWS)

PHYSICAL, CHEMICAL, AND MINERALOGICAL PROPERTIES OF FLUVIAL UNCONSOLIDATED BOTTOM SEDIMENTS IN NORTHWESTERN OHIO,
Ohio Agricultural Research and Development Center, Wooster. Dept. of Agronomy.
G. J. Wall, L. P. Wilding, and N. E. Smeck.
Journal of Environmental Quality, Vol 7, No 3, p 319-325, 1978. 5 fig, 5 tab, 16 ref.

Descriptors: *Bottom sediments, *Physical properties, *Chemical properties, *Mineralogy, *Ohio, *Water quality, Sediments, Clays, Heavy metals, Water pollution sources, Suspended load, Pollutants, Soil erosion, Unconsolidated sediments, Analytical techniques, *Clay mineralogy, *Sediment origin, *Heavy metal enrichment, *Mineralogical properties, *Maumee River(Ohio), Suspended sediment.

Fluvial unconsolidated bottom sediments that have the potential to become part of the suspended sediment load in the Maumee River Basin, Ohio, range in texture from sandy loams to clays. Particle size analysis by water dispersion and electrolyte dispersion procedures revealed that an average of 34% of the total clay fraction was aggregated into the silt and sand-sized range, indicating that the coarser fraction of bottom sediments may be physically-chemically active. The 2- to 50-micrometer fraction was dominated by quartz with secondary amounts of mica, kaolinite, feldspars, and carbonates. Mean calcite, dolomite, and calcium carbonate equivalent values were 4.1, 3.4, and 7.8%, respectively. Calcite dissolution in transport is probable on the basis of observed calcite-dolomite ratios. Organic matter content of the fluvial bottom sediments (3 to 7%) was analogous to Lake Erie bottom sediments and Maumee River suspended sediments. CEC values ranged from 39 to

55 meq/100 g for the total clay fraction collected by electrolyte and water dispersion procedures. Enrichment of heavy metals of bottom sediments over surficial soil materials occurred for Cu, Ni, Zn, Ca and Pb by factors of 1.6, 2.0, 2.3, 3.5, and 3.0, respectively. Traces of herbicides (atrazine, 2-4-D) and insecticides (DDT metabolites, endosulfan) were detected in the filtered stream water samples and bottom sediment materials. Downstream trends in selected physical, chemical, and mineralogical properties could not be related to increased urban influences or increased stream discharge. (Henley-ISWS)

EXCHANGE OF CARBON DIOXIDE BETWEEN THE ATMOSPHERE AND LAKE ONTARIO,
Canada Centre for Inland Waters, Burlington (Ontario); and National Oceanic and Atmospheric Administration, Ann Arbor, MI. Great Lakes Environmental Research Lab.
R. R. Weiler.
J Fish Res Board Can. 31(3), p 329-332, 1974.

Descriptors: *Atmosphere, Canada, *Carbon dioxide, Di, Exchange, *Lake Ontario, Primary production, Storm, Winter, Air-water interfaces.

The calculated flux of CO2 between Lake Ontario (USA, Canada) and the atmosphere ranged from about 0.1 gC m-2 day-1 during the summer to about 3 during a winter storm. During the summer, the amount of C supplied from the atmosphere was from 5-30% of the estimated amount utilized in primary production. Also Lyman's dissociation constants for carbonic acid were found applicable to the carbonate system of the lake.--Copyright 1974, Biological Abstracts, Inc.

The implication by Murthy and Ferrell (1972) that interstitial water studies are in a confused state is critized on the basis that the authors have not drawn on a considerable body of data, especially Soviet studies since the 1950's, and results of the Deep Sea Drilling Project. Pressure filtration systems for extracting interstitial waters are currently the methods of choice for marine studies and have achieved substantial reliability and reproducibility. Although gaps and problems remain, many aspects of interstitial composition of marine sediments have been clarified; these include the substantial constancy of composition of interstitial waters in deep sea pelagic deposits, depletion of interstitial cations owing to authigenic mineral formation in more rapidly accumulated (especially terrigenous) sediments, and special phenomena in sediments overlying salt deposits. Industrial Engineering Chemistry Process Design and Development, Volume 14, No. 4, 1975, p 473-478. 10 fig, 1 tab, 16 ref. (California Water Resources Center Project UCAL-WRC-W-392). OWRT A-051-CAL(4).

Descriptors: *Mass transfer, *Flow rates, Coefficients, *Trickle beds, *Two-phase flow, Liquid flow rates, Gas flow rates, *Gas-to-liquid mass transfer.

Mass transfer coefficients were measured at 25C and 1 atm for concurrent liquid (water) and gas flow in beds of small particles (0.054-0.29 cm) of napthalene and CuO-ZnO. The coefficients for transfer between particle and liquid are not greatly different for the three arrangements: upflow, downflow (trickle bed), or liquid full. At high gas rates and low liquid rates upflow gives somewhat higher transport rates, while trickle beds are favored over liquid-full operation at high liquid rates. Desorption of oxygen was measured to obtain liquid-to-gas coefficients when mass transfer in the liquid phase controlled interphase transport. For downflow such coefficients were independent of gas flow rate, but in upflow liquid-to-gas coefficients increased with gas rate. Upflow gave higher coefficients at high gas and liquid rates. Desorption of napthalene from water to air was employed to evaluate the gas-side coefficient in liquid-to-gas transfer for trickle-bed operation. The results showed a high sensitivity to gas flow rate and a modest sensitivity to liquid rate. (Snyder-Calif, Davis)

UTILIZATION OF LABELLED UREA AND AMMONIUM SULFATE BY LOWLAND RICE,
Louisiana State Univ., Baton Rouge. Dept. of Agronomy.
K. R. Reddy, and W. H. Patrick, Jr.
Soil Science Society of America Journal, Vol. 42, No. 3, p 465-467, May-June, 1978. 4 tab, 4 ref.

Descriptors: Stable isotopes, *Ureas, *Ammonium compounds, Nitrogen, Fertilizers, Fertilization, *Rice, Flood irrigation.

The objective of this investigation was to compare labelled ammonium sulfate and urea in their effect on yield and N utilization in field microplots on Crowley silt loam (typic albaqualf). Nitrogen was applied as an early season topdressing or as a midseason topdressing and the grain and straw yield and recovery of labelled and native N in the grain straw, and soil were measured. No significant differences in grain and straw yields were observed for the two sources and two times of N application. Ammonium sulfate and urea did not differ significantly in N utilization by the crop. For both sources the recovery of labelled N in the soil-plant system was highest (34 to 55 kg N/ha) in the plots receiving early season topdressing (30 to 38 kg N/ha). More native soil N was taken up by the plants during 1976 as compared to the 1975 season. (Skogerboe-Colorado State)

SIMULATION OF NITROGEN PROCESSES IN SOILS FOR ESTIMATING FERTILIZER REQUIREMENTS,
Technion - Israel Inst. of Tech., Haifa. Faculty of Agricultural Engineering.
G. Kruh, J. Hagin, and S. Sharon.
Soil Science, Vol. 125, No. 4, p 255-260, April, 1978. 3 fig, 2 tab, 19 ref.

Descriptors: Fertilization, Computer models, *Simulation analysis, *Cotton, Ammonium compounds, *Nitrates, Soil moisture, Crop response, Timing, *Fertilizers, Model studies.

In a field experiment on cotton, ammonium sulfate was applied to give 60, 120, and 180 kg N/ha, all in winter, early spring, and late spring applications. A check treatment was included. Soil samples to a depth of 120 cm were taken from time to time, and moisture and nitrate concentrations were meas-

ed. The early spring fertilization at the two ver levels of application produced higher yields n the two other application times. With a maxi- m at the 120-kg N/ha level. The highest level of plication induced a yield depression. The early ing application produced a nitrate distribution the soil profile with a peak in the 20-40 cm pth. The yield results were partially explained the nitrate distribution in the soil profile during early growth period. A computer program ulated well, within experimental errors, the ni- te distribution in the soil profile. It was conclud- that such a program could improve consider- y nitrogen fertilizer requirements and timing dictions. (Skogerboe-Colorado State)

scriptors: *Cation exchange, *Gypsum, Cal- m, Magnesium, Sodium compounds, Ammoni- compounds, Soil profiles, Particle size, ls(Gypsiferous).

ofiles of gypsiferous soils from the Euphrates in of Iraq and Syria were studied. Increasing eness of grinding, from 10, 50, 100, and 170 to -mesh, increased the measured amounts of sum and soluble Ca + Mg. These variables increased as the soil:water ratio increased i.e., 0, 1:100, and 1:500. Cation exchange capacity ues at 10, 100, and 270-mesh sizes were deter- ed by various procedures: 1N NaOAC/ H4OAC solutions prepared with distilled water with 1:1 water-acetone mixture; pretreatments the soil with 2N BaCl2.2H2O, saturated 2C2O4, and saturated (COOH)2.2H2O by shak- for variable periods up to six days. After each treatment, CEC was determined by the conven- nal NaOAC/NH4OAC procedure. Highest ues were obtained after pretreatment, the order ng Na2C2O4, BaCl2.2H2O, and OOH)2.2H2O. Values increased with time of king during pretreatment and with increasing eness of particle size. Criteria are presented for ermining gypsum and CEC in soils containing nificant amounts of gypsum. Descriptors: *Model studies, *Estuaries, *Chesapeake Bay, *Flow, Mathematical models, Fluid mechanics, Analytical techniques, Numerical analysis, Currents(Water), Velocity, Diffusion, Equations, Tides, Tidal effects, Water temperature, Finite element analysis, Heat balance, Salt balance, Salinity, Three-dimensional flow.

The described model was based upon numerical integration of the flow equations which simulate the water movements caused by tides, wind, and pressure differences, and upon numerical integration of the advective diffusion equation representing the movements of salt and temperature. The model neglects vertical accelerations, but not vertical velocities, and includes an approximation for the sub-gridscale effects by introduction of mass and momentum exchange coefficients. These coefficients are dependent upon the Richardson number and vertical velocity gradients. The computation method was tested on an estuary, and the results of the simulations were presented in graph form. The three-dimensional flows in estuaries with nonisotropic density distributions can be computed effectively according to the finite difference method described. The model requires coefficients used in describing the small-scale mass and momentum exchanges. These coefficients must be found experimentally from field data. (Humphreys-ISWS)

NUMERICAL SIMULATION OF TIDAL HYDRODYNAMICS, GREAT EGG HARBOR AND CORSON INLETS, NEW JERSEY,
Army Engineer Waterways Experiment Station, Vicksburg, MS.
H. L. Butler.
Technical Report H-78-11, June 1978. 138 p, 5 append, 76 fig, 5 tab, 15 ref.

Descriptors: *Inlets(Waterways), *New Jersey, *Tidal hydrodynamics, *Navigation channels, *Great Egg Harbor, Inlet(NJ), *Corson Inlet(NJ), *Numerical simulation.

Great Egg harbor Inlet and Corson Inlet, located in southeast New Jersey, have been plagued with hazardous navigation conditions and erosion problems. Numerical techniques were used to investigate the tidal hydrodynamics of the inlet complexes for existing conditions and for proposed improvement plans. Physical size and complex geometry of the study areas required a simulation model that could be economically applied. Consequently, and inherent part of the study involved development of a numerical model (WI model) based on an implicit finite difference formulation. The model includes treatment of moving boundaries and subgrid-scale barriers. A comparison study with a well-known explicit finite diference tidal model was performed to assure the implicit model's reliability and cost effectiveness. The WI model was then applied to Great Egg Harbor and Corson Inlets to quantitatively predict the tidal hydrodynamics (exclusive of salt and sediment transport) for existing conditions and various improvement plans. Results indicate the systems proposed for Corson Inlet appear to function equally well and no detrimental effects were noted. For Great Egg Harbor Inlet, a concentration of ebb flow toward the upcoast deposition basin and structure was noted, suggesting a potential problem which should be recognized for the proposed plans. APPLICATIONS OF MIXING EXPERIMENTS TO ESTUARIES,
Johns Hopkins Univ., Baltimore, MD.
R. R. Long.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A029 221, Price codes: A02 in paper copy, A01 in microfiche. In: Proceedings of the Speciality Conference on 'Civil Engineering in the Oceans/III,' American Society of Civil Engineers, June 9-12, 1975, University of Delaware, Newark, p 1400-1419. 6 fig, 28 ref. ONR N00014-75-C-0805.

Descriptors: *Estuaries, *Mixing, *Mathematical models, *Froude number, *Saline water-freshwater interfaces, Salinity, Critical flow, Tidal waters, Fjords, Density stratification, Model studies, Two-layer models, Richardson number.

The paper first considered estuarine circulations i deep, two-layer, fjord-type estuaries, ignoring th details of the mass distribution and the circulation in the main body of the estuary and concentratin on the flow conditions and interface depth in th vicinity of the mouth. The flow near the mout was considered to be frictionless and the pressur hydrostatic, and the first part of the analysis a sumed strong mixing. Phenomena in this state ar functions of a non-dimensional number Q sub proportional to the freshwater influx. On the othe hand, the problem is also solvable when the mixin is zero. The two extreme cases suggest a simpl dependence on a mixing number M for arbitrar mixing. This permits a complete solution for th ocean water flux, brackish water flux, depth of th interface at the mouth, salinity of the brackis water, depth of the halocline in the main body o the estuary, and height above sea level of the fre surface in the estuary, all as functions of Q sub and M. The second part of the paper presented complete solution for flow conditions and mas distributions in a deep, two-layer rectangular est ary. Mixing occurs across the interface, and fri tion is a dominant factor. The interface slope downward toward the mouth, reaching a max mum depth at a certain section. Beyond this, th interface rises. At the mouth, where by definitio the width of the estuary increases rapidly, it wa found that there must be a transition from subcrit cal to supercritical flow. The solution is dete mined by the freshwater influx per unit width, th turbulent velocity, the estuary length, and th buoyancy of seawater. (Adams-ISWS)

Descriptors: *Waves(Water), *Ocean wave *Beaches, *Model studies, Mathematical models Equations, Mathematics, Theoretical analysis Shores, Coasts, Edge waves, Nonlinear waves.

The excitation of standing edge waves of frequen cy 1/2 omega by a normally incident wave train o frequency omega was discussed previously on th basis of shallow water theory. In this paper, th problem was formulated in the full water wav theory without making the shallow water approxi mation and solved for beach angles Beta=pi/2N where N is an integer. The work confirmed th shallow water results in the limit N much greathe than 1, showed the effect of larger beach angles and allowed a more complete discussion of som aspects of the problem. sults of a parametric study are presented of one- d two-stage reverse osmosis for (RO) systems alination of sea water are presented. Optimiz-on of RO systems was approached using a re-tly developed computer program which ap-ed membrane manufacturers' performance data d predicted costs. Based on these data and other uipment and operating costs, a preliminary eval-ion of the economics of reverse osmosis for sea ter desalination was made. Plant capacities in range of 1 Mgd were considered and compared onomically with the current most common mul-age flash (MSF) distillation process at different ergy price levels. It was concluded that reverse nosis desalination plants are competitive with SF plants in the 1-Mgd range and, if projected technology is realized, in the 2.5-Mgd range. However, it is evident that reverse osmosis cannot compete with dual purpose MSF plants. (Majtenyi-IPA)

WATER REQUIREMENTS AND DESALTING IN THE UNITED STATES OF AMERICA,
M. V. Hughes, Jr.
Desalination, Vol. 21, p 301-307, 1977. 9 fig, 1 tab, 8 ref. Based on a talk presented February 23, 1977. the Technology Transfer Conference, Desalting State-of-the Art Review, Reston, VA.

Descriptors: *Desalination, *Water resources, *Water utilization, *Water requirements, *Projections, Data, Irrigation, Recycling, Water pollution control, Water quality, Water demand, Water reuse, Planning, Brackish water, Desalination plants, Water sources.

The impact of U.S. water requirements on the need for desalination is discussed using data from preliminary figures of the 1975 Water Assessment of the Water Resources Council. A great potential for increases in desalination is predicted because of the large and increasing water requirements for industrial, municipal, and energy uses. Principal locations of U.S. desalination plants and their capacities are tabulated and the type of usage in relation to capacity is expressed graphically. Irrigation is discussed in detail because it is the largest consumer of water with about 80% of the 1975 consumption. In addition, increased salinity due to irrigation return flows places additional burdens on water resources. Increases in industrial consumption and higher standards for treating waste water indicate that desalination will be used increasingly in the future. The reuse of water and turning to brackish and ocean water to supplement scarce local supplies of fresh water will require additional desalination facilities. (Majtenyi-IPA)

FORWARD OSMOSIS EXTRACTORS: THEORY, FEASIBILITY AND DESIGN OPTIMIZATION,
Arizona Univ., Tucson. School of Renewable Natural Resources.
C. D. Moody.
Available from National Technical Information Service, Springfield, VA, 22161 as PB-289 251, Price codes: A07 in paper copy, A01 in microfiche. Ph.D. Dissertation, 1977. 135 p, 18 fig, 6 tab, 52 ref, 6 append. OWRT B-053-ARIZ(4), 14-34-0001-7137.

Descriptors: *Osmosis, *Desalination, *Membrane processes, Separation, Cost analysis, Concentration polarization, Reclamation, Agriculture, Irrigation, Greenhouses, *Optimization, *Forward osmosis.

Osmosis occurs when two solutions of differing osmolar concentrations are separated by a membrane permeable to the solvent but not to the solutes. In osmosis, water flows spontaneously from the low concentration source solution to the high concentration driving solution. Forward osmosis is examined as a low-technology, low-energy use processes for hydration and dehydration of aqueous solutions. The fundamental mechanical device is a continuous counterflow extractor which incorporates a semipermeable membrane separating the source and driving solutions. The counterflow design permits maximum water recovery from the source solution and maximum dilution of the driving solution. The nonlinear differential equations describing the water and solute flows in the extractor are solved using analytical and numerical techniques. The resulting mathematical models contain design equations which can be used to determine the optimum membrane transport charcteristics, optimum membrane size, and the asymmetric membrane orientation which minimizes concentration polarization. Theoretical and experimental results compare well. Two applications discussed in detail are the production of potable water from seawater using human nutrients, and fertilizer-driven forward osmosis (FDF) for converting saline water to irrigation water.

MUNICIPAL WATER SUPPLY SYSTEM,
J. L. Rugh, II.
U.S. Patent No. 4,102,752, 4 p, 1 fig, 14 ref; Official Gazette of the United States Patent Office, Vol 972, No 4, p 1604, July 25, 1978.

Descriptors: *Patents, *Desalination, *Desalination plants, *Potable water, Domestic water, Water purification, Water treatment, Nuclear reactors, Nuclear powerplants, Temperature.

A municipal water supply system provides potable water under pressure from seawater and includes a nuclear reactor heated boiler for raising the temperature of sea to at least 250F and at superatmospheric pressure. The superheated steam is conveyed to an expansion turbine where the steam drives a turbine while the temperature of the steam is reduced to about the boiling point of water at atmospheric pressure. A heat exchanger condenses the exhaust from the turbine while simultaneously preheating incoming sea water to the system. Liquid pumping means driven by the expansion turbine for conveying the condensed water under pressure to a municipal distribution are provided. Additionally, are provided for controlling the temperature within the boiler chamber by controlling the volume of incoming sea water. (Sinha-OEIS)

DEVELOPMENT AND EVALUATION OF IMPROVED FILMS FOR SUPPRESSING WATER EVAPORATION,
Arizona State Univ., Tempe. Dept. of Chemical Engineering.
C. O. Reiser, and T. J. Ruhoff.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-289 230, Price codes: A02 in paper copy, A01 in microfiche. University of Arizona, Tucson, Water Resources Research Center, Project Completion Report, July 1978. 15 p, 5 fig, 1 tab, 9 ref, append. OWRT A-061-ARIZ(1). 14-31-0001-5003.

Descriptors: *Evaporation control, Wave suppression, *Monomolecular films, Chemical films, *Water conservation.

A small water-wind tunnel with an air passage 0.24 m high by 0.22 m wide and 6.5 m long over a water layer 7 cm deep has been used for the dynamic testing of surface films for evaporation control. Differences in the entering and exit humidity were determined at air speeds up to 11 m/sec when feeding water suspensions of resistant films at the tunnel entrance. At the conditions used, long-chain alcohol films with 16 to 20 carbons mixed with 10% of a C18 monoethoxylate gave about 50% evaporation reduction and were about twice as effective as multilayer films containing linoleic acid polymerized with polyvinyl alcohol. Wave dampening above 11 m/sec (24.5 mi/hr) is difficult and no significant difference in wave suppression was observed between these two types. Further investigations using this equipment, which models natural conditions, are needed to develop more wind-resistant films in an effort to commercialize a promising method of water conservation.

REDUCING PHREATOPHYTE TRANSPIRATION,
California Univ., Davis. Dept. of Land, Air and Water Resources.
D. C. Davenport, and R. M. Hagan.
In: Hydrology and Water Resources in Arizona

and the Southwest, Vol. 6, April-May, 1976, p. 141-146. 2 fig, 4 tab, 6 ref. OWRT C-6030-(No. 5325) (2).

Descriptors: *Antitranspirants, *Transpirants, *Riparian water loss, Tamarisk, Cottonwoods, *Phreatophytes, *Transpiration rates, Plant transpiration, Water conservation, Water yield improvement.

Transpiration rates (T) of riparian phreatophytes can be high. Antitranspirant (AT) sprays can curtail T without ecological imbalance made by eradication. Saltcedar (Tamarix sp.) and cottonwood (Populus sp) in 15-gal. drums enabled replicated trials on isolated plants or on canopy. T for a unit ground area of saltcedar varied from 2.2 (sparse-) to 15.8 (dense-stand) mm/day in July at Davis. Extrapolation of experimental T data to field sites must, therefore, be made carefully. Wax-based ATs increased foliar diffusive resistance (R), and reduced T of slatcedar and cottonwood 32-28% initially and 10% after 3 weeks. R increased naturally in the afternoon when evaporative demand was high and if soil water was low. Nocturnal T of salt cedar was 10% of day T. AT effectiveness increased with a higher ratio of day: night hours, and with lower soil water stress. Therefore, AT will be most effective on long summer days in riperian areas where ground water is available. (Snyder-Calif, Davis)
W79-01562

A NONDESTRUCTIVE APPROACH TO REDUCING RIPARIAN TRANSPIRATION,
California Univ., Davis. Dept. of Land, Air and Water Resources.
D. C. Davenport.
In: Riparian Forests in California, Their Ecology and Conservation Institute of Ecology, University of California, Davis Publication No. 15, May 14, 1977, p 103-110. 1 fig, 1 tab, 39 ref. OWRT C-6030(No. 5235)(3).

Descriptors: *Riparian plants, *Riparian land, *Transpiration, *Antitranspirants, Plant transpiration, Phreatophytes, Water conservation, Water yield improvement.

The continuous availability of ground water to riparian phreatophytic vegetation results in large transpiration losses to the atmosphere. These are most significant in summer when high transpiration rates coincide with peak demands for ground- and stream-water. While complete eradication of riperian vegetation can increase stream flow, it can also cause undesirable physical (e.g., erosion) and ecological (e.g., to wildlife) disturbances. On the other hand, spraying a non-destructive antitranspirant (e.g., a wax-based emulsion) on riparian vegetation can reduce transpiration, by over 50% in lab. tests and 30% in field tests, with no phytotoxicity. This alternative to eradication is being tested as a means of improving ground and surface-water supplies with minimum risk of environmental damage. (Snyder-Calif, Davis)
W79-01586

METHOD AND MEANS OF TREATING WATER WELLS,
Moran (Thomas L.), Amarillo, TX. (Assignee).
D. M. Paul.
U.S. Patent No. 4,103,743, 6 p, 3 fig, 12 ref; Official Gazette of the United States Patent Office, Vol 973, No 1, p 141, August 1, 1978.

Descriptors: *Patents, *Water wells, *Water sources, *Water yield improvement, Water supply, Combustion, Acids, Artificial recharge, *Water pollution treatment.

A method and means for chemically treating water wells to increase the production is described. Liquid chemical, usually acid, is initially placed in the well through the water discharge conduit of the well head or pump apparatus. Compressed air is initially forced into the interior of the column pipe in the casing to sense the depth of the water so that pressure sensitive gauges in the circuitry may be set according to the water depth. Compressed air is then forced into the column pipe to force some of the water into the water bearing formation. A combustible mixture of air and gas is then introduced into the upper end of the column pipe and ignited so that the force of combustion expels the water and acid in the casing through the slits in the well casing into the water bearing formation. The heated bases of combustion cool rapidly and the combustion step is repeated approximately 200-300 times over a period of approximately three hours. The heat of combustion increases the temperature of the water and acid to approximately 108F which enhances the action of the acid. The impact of combustion also tends to loosen or break any encrustation which is present in the water bearing formation. The well is then pumped for approximately 2 to 3 hours to remove the acid and residue. (Sinha-OEIS)

CORN AND ALFALFA PRODUCTION AS INFLUENCED BY IRRIGATION AND SALINITY,
Utah State Univ., Logan.
R. J. Hanks, T. E. Sullivan, and V. E. Hunsaker.
Soil Science Society of America Journal, Vol. 41, No. 3, p 606-610, May-June 1977. 5 fig, 6 tab, 9 ref. OWRT C-5189(No. 4233)(1), B-121-UTAH(1).

Descriptors: *Corn(Field), *Crop response, *Salinity, Soil moisture, *Irrigation effects, Evapotranspiration, *Crop production, *Alfalfa.

Yields of corn and alfalfa were determined where both salinity and water stress were imposed. Yields of corn at Logan, Utah in 1975 were decreased by salinity or water stress (caused by low irrigation levels) in direct relation to the decrease in evapotranspiration. The decrease in evapotranspiration was caused by a decrease in soil water depletion, indicating that salinity influenced soil water availability. Corn yields at Vernal, Utah in 1974 were decreased by salinity, but to a considerably lesser extent by low irrigation, probably because of water flow upward into the root zone from a water table. Alfalfa yields at Vernal in 1974 were not decreased by salinity or by low irrigation rates, because of water supplied by a water table and used by roots below the zone of salinity. TESTING SALT TOLERANCE VARIABILITY AMONG TALL WHEATGRASS LINES,
Agricultural Reseach Service, Riverside, CA. Salinity Lab.
M. C. Shannon.
Agronomy Journal, Vol. 70, No. 5, p 719-722, September-October, 1978. 1 fig, 3 tab, 22 ref.

Descriptors: *Wheatgrasses, *Salt tolerance, Varieties, Variability, *Plant breeding, Plant physiology.

In the present study a screening procedure was evaluated to determine its usefulness in detecting variation among introductions of tall wheatgrass (Agropyron elongatum (Host) Beauv). In greenhouse sand flats, 32 lines of tall wheatgrass were established and subjected to stepwise increases in sainity up to 765 meq/liter or until severe lead damage resulted. The lines were classified into five groups based on relative leaf damage and recovery rates from salt treatment. Repeating the screening procedure of seven each of the most tolerant and most sensitive lines reaffirmed the results of the first screening. Mineral analyses indicated that tolerance was associated with restricted accumulation of Na, Ca, and Cl in the shoots. Proline and soluble sugars contributed to osmotic adjustment at high salinities, but sensitive and tolerant lines did not differ in proline content. This screening technique appeared to discriminate between lines with different ion transport properties and different salt tolerances. The sensitivie and tolerant lines identified may be beneficial in future breeding and physiological studies. (Skogerboe-Colorado State)

RESPONSES OF STOMATA AND WATER, OSMOTIC, AND TURGOR POTENTIALS OF JOJOBA TO WATER AND SALT STRESS,
California Univ., Riverside. Dept. of Soil and Environmental Sciences.
J. A. Adams, F. T. Bingham, M. R. Kaufmann, G. J. Hoffman, and D. M. Yermanos.
Agronomy Journal, Vol. 70, No. 3, p 381-387, May-June, 1978. 4 fig, 2 tab, 42 ref.

Descriptors: *Desert plants, Soil-water-plant relationships, *Salt tolerance, *Drought tolerance, *Turgidity, Transpiration, *Stomata, Xylem, *Jojoba.

Jojoba (Simmondsia chinensis (Link) Schneider) is a desert shrub which can provide a much needed substitute for sperm whale oil. Because of the absence of soil-plant-water data for jojoba and the limited amount of such information for desert plants in general, selected plants were water-and-salt-stressed in greenhouse soil and sand culture experiments. Responses of leaf water, osmotic, and turgor potentials to stress and associated stomatal behavior were studied. (Skogerboe-Colorado State)

ploying a Q-Sort Factor Analytical Design, this y sought to develop a system for parametric esentation of nonlinear data structures using acquired from representative samples of entire munities. The representations are specified in ns of a spatial metric 'social space', an analogue sychological space. The defined social space is characterized and used to define the community action zone which is hypothesized to a zone of community acceptance for those policies falling within its bounds. Such a zone for the communities of Lafayette and Louisville, Colorado was used to define socially and politically feasible water conservation policies for the communities. Policies with the highest feasibility for acceptance were legal restrictions on water use and restrictions on growth and development. The next most feasible were horitcultural techniques and economic solutions. Reuse for agricultural purposes also appeared to have some political feasibility. This study demonstrated the usefulness of survey research in delineating viable water conservation programs.

This paper summarizes results of studies on geothermal dual-purpose power and water production plants using geothermal and other working fluids. Combinations of heat exchanger and direct contact condensers with evaporative, dry and mixed cooling are considered. Effects of system parameters on production are given. Higher temperatures favor the use of open, or water, cycles, particularly when brines are low in dissolved solids, noxious gases and bicarbonates. At lower temperatures, either the water or the binary fluid cycle may be preferrable, depending on conditions. (Snyder-Calif, Davis)

AUSTRIAN NATIONAL REPORT ON NON-WASTE TECHNOLOGY,
R. Kauders, and U. Ousko-Oberhoffer.
In: Non-Waste Technology and Production, Pergamon Press, 1978, p 77-104, 1 fig.

Descriptors: *Pulp and paper industry, *Water pollution control, *Austria, Technology, Economics, Resources, Conservation, Water conservation, Heat, Filters, Slime, Water reuse, Recycling, Coals, Quartz, Gravels, Foreign countries, Europe, Sulfur dioxide, Magnesium oxide, Spent sulfide liquor, Boxboard, Waste paper, Chemical recovery, Chemical industry.

This report outlines and gives some technological and economic details for 19 already practiced procedures plus 3 still under development in Austrian chemical industries for resource conservation and environment protection. Among the approved technologies, two are concerned with pulp, paper, and board manufacture, viz., (1) the Lenzing magnesium bisulfite recovery process for recovering MgO, sulfur dioxide, and heat from spent sulfite liquor of 15% solids content; and (2) the production of folding boxboard (250 tons/day) from a furnish comprising up to 85% waste papers, with considerable water conservation (reduction of waste waters from 8,000 to 1,000 cu m/day) and without water pollution, via a process developed by Ruthner Industrieanlagen AG. (Vienna) which involves 4 closed filter boilers (with quartz gravel and hydroanthracite filter media), a reactivator for separating fines, and dosing of recycled process water with bleach liquor to prevent slime problems. (Brown-IPC)

HOW AND WHY WE CHOSE INTEGRAL RECYCLING (AT THE ISOREL FIBERBOARD PLANT, CASTLEJALOUX, FRANCE),
Isorel, Puteaux (France).
B. Marechal.
In: Non-Waste Technology and Production, Pergamon Press, 1978, p 231-238. 5 fig.

Descriptors: *Pulp wastes, *Water pollution control, *Hardboard mills, *France, Control systems, Wastes, Industrial wastes, Water pollution sources, Water pollution treatment, Aerated lagoons, Water reuse, Recycling, Water conservation, Water pollution, Closed systems, Insulation board, Fiberboard mills, Pollution abatement, Suspended solids.

After considerable efforts and disappointing results with the economics of external effluent treatment measures to abate water pollution at a wet-process hardboard and insulation board factory, the Isorel company developed a closed-circuit manufacturing process involving the installation of a buffer tank between the plant and the river, with two stand-by aerated lagoons in case of pipeline breakage, and a luminous process-control panel for monitoring all sensitive points in the water circuits. Adaptation to the high-solids process stream (90-100 g of dry solids/liter) required modifications in the thermomechanical pulp refining, stock dewatering, and hot-pressing procedures, as well as many smaller adjustments in equipment operation. Water pollution has been drastically cut from 110 to 0.8 kg/ton of building board produced, equivalent to 99.3% efficient abatement. (Brown-IPC)

STATUS OF THE CLOSED-CYCLE CONCEPT KRAFT MILL AT GREAT LAKES PAPER CO.,
Great Lakes Paper Co., Ltd., Thunder Bay (Ontario).
J. A. Isbister, D. W. Reeve, and W. H. Rapson.
Paper Trade Journal, p 32-36, October, 1978.

Descriptors: *Industrial water, *Waste reuse, *Bleach wastes, *Recycling, *Industrial wastes, *Pulp and paper industry, Pulp wastes, Evaporation, Biochemical oxygen demand, Corrosion, Desalination, Operation and maintenance, Water pollution control, Pilot plants, Chlorine compounds, Waste water treatment.

The 800 tpd bleached kraft pulp mill operated by Great Lakes Paper Co. in Thunder Bay, Ontario, Canada, accommodated the first application of the Rapson-Reeve (closed-cycle) concept. The 'B' mill, which started up in 1976, employs a D/C-C-E-D-E-D bleach sequence, salt recovery, and high chlorine dioxide use (70%) in the first bleaching stage. Water consumption at the bleach plant is minimized to balance with inputs in the form of recovered filtrate. Four spill pits were incorporated into the design of the closed-cycle system; future efforts will be directed toward collecting all spills during shutdowns and upsets for return to processing without overflow. At present, process effluent is still discharged during upsets. Current objectives for the closed-cycle system include reducing defoamer and bleach chemical consumption, preventing corrosion of washer drums and the recovery furnace precipitator, increasing the black liquor Btu value to reduce external fuel makeup requirements, and improving overall coordination of mill operations. Of the 8.3 ton/day total BOD discharged by the mill, the sextuple-effect evaporator condensates and foul condensates contribute the largest quantity not associated with bleaching operations (4.9 tons/day). On the basis of the performance of the 'B' mill, the Ontario Ministry of the Environment has recommended that a similar closed-cycle recovery system be installed in another Great Lakes Paper Co. mill in the Thunder Bay complex. INVENTORY OF WETLAND HABITAT USING REMOTE SENSING FOR THE PROPOSED OAHE IRRIGATION UNIT IN EASTERN NORTH DAKOTA
South Dakota State Univ., Brookings. Remote Sensing Inst.
R. G. Best, and D. G. Moore.
Available from the National Technical Information Service, Springfield, VA 22161 Price codes: A03 in paper copy, A01 in microfiche. 1977. 14 p, 8 fig, 5 tab, 3 ref, 2 append.

Descriptors: *Wetlands, *Census, *South Dakota, *Aerial photography, *Wildlife habitats, Marshes, Wildlife management, Mapping, Remote sensing, Freshwater marshes, *Oahe irrigation project(SD), *Type I wetlands, Wildlife mitigation plan.

An inventory of wetland for the area included in the proposed Oahe Irrigation Project was conducted to provide supplemental data for the wildlife mitigation plan. This report, including the data summaries, follows a report which documented the interpretation techniques as presented by Best, Moore, and Brewster for inventorying small, predominatly Type I wetlands in the low-relief terrain of the Lake Dakota Plain. Wetland habitat in over 310,000 acres in the Oahe irrigation district was inventoried. There were 5305 wetlands representing 7530 acres, 589 acres of natural drains, and 1545 acres of stream habitat in the area. The data were stored and tabulated in a computerized spatial data analysis system. The data summaries are provided for various spatial stratification. (Steiner-Mass)

SPRINKLER IRRIGATION PRACTICES AND WATER LOSSES: WATER SHORTAGES UNDERLINE NEED FOR CONSERVATION,
Texas Agricultural Extension Service, College Station.
R. L. Duble.
Irrigation Journal, Vol 27, No 2, p 16-17, 20, 46, March-April, 1977. 3 fig.

Descriptors: *Sprinkler irrigation, *Irrigation practices, Irrigation systems, *Water conservation, Water resources, Turf, Irrigation efficiency.

Having witnessed the effects of a water shortage in many sections of the country during the summer of 1976, the value and need for conservation of water can be appreciated. Since scientists forecast more extensive droughts throughout the next decade, people must become more conscious of water use. In order for there to be adequate water supplies for turf irrigation in the future, careful management of water resources is necessary and must be implemented now. (Skogerboe-Colorado State)

criptors: *Nitrates, Translocation, uction(Chemical), *Barley, *Organic acids, abolism, Calcium, *Potassium, Growth cham-, *Hydrogen ion concentration.

absorption, translocation, and metabolism of influenced by the source of N and was influ-d by the source of N and by the availability mobility of counter ions for transport. The ose of this study was to determine the influ-e of K or Ca on nitrate uptake, translocation, reduction in barley seedlings. Six-day-old ey seedlings were grown for 2 to 36 hours in tions of 1.0 meq/liter KNO3 or Ca(NO3)2, containing 0.4 meq/liter of CaSO4. Experi-ts were conducted in a growth chamber at 27C a photosynthetic irradiance of 5.3 mW times 3. Seedlings treated with Ca(NO3)2 (low K) lower levels of nitrate uptake, nitrate reductase ity, and lower organic acid concentrations seedlings treated with 1 mM KNO3. The tion pH and the expressed sap pH of roots and ts of the low K seedlings increased during the riment. The shoots of the low-K seedlings had h lower nitrate concentrations and lower s of nitrate reductase activity than the roots, esting that K plays a major role in nitrate location. These results support the hypothesis potassium malate is cycled from the tops to oots where decarboxylation occurs, providing urce of HCO3(-) for exchange with NO3(-) g absorption. LUATION OF PEAT AND GRANULAR IN-LUM FOR SOYBEAN YIELD AND N FIX-ON UNDER IRRIGATION,
hington State Univ., Pullman. Coll. of Agri-re Research Center.
. Bezdicek, D. W. Evans, B. Abede, and R. E. ers.
nomy Journal, Vol. 70, No. 5, p 865-868, ember-October, 1978. 1 fig, 5 tab, 15 ref.

riptors: *Nitrogen fixation, *Soybeans, ts, Granules, Symbiosis, *Crop production.

purpose was to evaluate peat and granular lum for effectiveness in nodulation, N fix-, and yield of soybeans in a soil deficient in N. mum yield response from inoculation (less ol) was 3,454 kg/ha (51.4 bu/A) in 1975 and kg/ha (37.9 bu/A) in 1976. Total N fixed was ated to be as high as 311 and 263 kg/ha in and 1976, respectively. The proportion of N derived from N fixation ranged from 71 to ercent. Estimates of total N fixed based on lene reduction were half of those based on plant N. In general, higher soybean yield and r nodulation were obtained with the granular peat carriers, although in these instances, er-than-recommended rates of granular carri-ere used. These studies show that soybeans capable of fixing over 300 kg/ha of N, an nt which is considerably higher than that ted elsewhere. The data suggest that in soy-growing areas where 25 to 40 percent of the N is from fixation, the soybean symbiotic N-system is capable of fixing sufficient N for s far beyond that now reported. IRRIGATION EFFECTS ON VEGETATIVE AND REPRODUCTIVE DEVELOPMENT OF THREE SOYBEAN CULTIVARS,
Georgia Univ., Athens. Dept. of Agronomy.
D. A. Ashley, and W. J. Ethridge.
Soil Science Society of America Journal, Vol. 42, No. 3, p 467-471, May-June, 1978. 6 tab, 13 ref.

Descriptors: *Soybeans, *Supplemental irrigation, Growth stages, *Plant growth, *Irrigation effects.

This field experiment considered four moisture regimes-no irrigation, full season irrigation, irrigation starting at bloom stage, and irrigation starting at pod fill stage-on three soybean cultivars, 'Ransom', 'Hamptom 266A' and 'Coker 102'. Data were collected for seed yield, pod number and dry weight, dry weight of vegetative components during reproductive developmet and seasonal soil moisture status. The soil was a sandy loam. Full season and bloom stage irrigation treatments produced higher yields than the unirrigated check except for Hamptom 266A in 1974. Yields from plants receiving the podfill stage irrigation treatment were higher than the unirrigated check in drier seasons of 1972 and 1973 but not in 1974. Irrigation beginning at pod fill produced yields equal to the full season and bloom stage treatments in some cases and somewhat lower yields in other cases. Water application prior to blooming greatly increased vegetative dry weight, number, and dry weight of pods. Beginning irrigation during reproductive development had litle effect on vegetative dry weight, but ussually resulted in a greated number of pods late in the season than the unirrigated check. Higher yields and greater response to irrigation were obtained from shorter Ransom plants than the other two cultivars. (Skogerboe-Colorado State)

ALFALFA WATER USE AND PRODUCTION ON DRYLAND AND IRRIGATED SANDY LOAM,
North Dakota State Univ., Fargo. Dept. of Soils.
J. W. Bauder, A. Bauer, J. M. Ramirez, and D. K. Cassel.
Agronomy Journal, Vol 70, No. 1, p 95-99, January-February, 1978. 2 fig, 3 tab, 12 ref.

Descriptors: *Alfalfa, *Irrigation effects, Soil-water-plant relationships, Moisture stress, Evapotranspiration, *Fertilization, *Crop production, Great Plains, Correlation analysis, *Loam, Sands.

This study was carried out on a Maddock sandy loam soil, a member of the sandy, mixed frigid Udorthentic Haploboralls. Four irrigation levels, ranging from dryland to excessive irrigation, were established as whole plots in a randomized block, split plot design. Eight different fertilizer treatment of P, K, and S were applied to split plots during the 1st year of the study. Under a three harvest per season management system dry matter yield was significantly affected by harvest number and irrigation treatment each year. Within the dryland and deficient irrigation treatment by year, yields decreased with each cutting; with optimum and excessive irrigation, yields varied inconsistently with cutting; yields increased 14 to 330 percent over dryland by increasing irrigation applications. When plant water stress existed throughout the growing season, relative yield correlated with relative evapotranspiration in a near perfect, linear manner. Under nonstress conditions, irrigation, growing season precipitation, and soil water depletion required consideration to attain nearly perfect correlation of relative yield with relative evapotranspiration. The results of this study indicated that under plant water stress conditions, alfalfa dry matter yield is a linear function of plant water use. (Skogerboe-Colorado State)

EFFECT OF SOIL MATRIC POTENTIAL AND SEEDING DEPTH ON EMERGENCE OF BARLEY,
Pahlavi Univ., Shiraz (Iran). Dept. of Irrigation.
A. R. Sepaskhah, and E. R. Ardekani.
Agronomy Journal, Vol. 70, No. 5, p 728-731, September-October, 1978. 4 tab, 17 ref.

Descriptors: *Barley, Germination, Emerging vegetation stage, *Seeds, Moisture tension, Crop production, Crop response, *Soil matrix potential.

The effect of soil matric potential and seeding depth on emergence percent and rate of emergence of barley were investigated. Seedling emergence of 'Zarjo' cultivar of barley was measured in a Calcixerollic Xerochrept soil at -0.6 to -30.0 bars soil matric potentials and at 2 to 12 cm seedling depths in the greenhouse. Cultivar response to seedling depth was determined by seedling emergence measurements of 'Torsh', Zarjo, and 'Shaneii' cultivars at seeding depths of 2 to 12 cm under the same experimental conditions. Soil matric potential of -30.0 bars reduced the seedling emergence of Zarjo and resulted in the lowest emergence rate. However, soil matric potentials of -0.6 and -1.5 bars also reduced Zarjo emergence at the 12-cm seeding depth. Seedling emergence and emergence rate of Zarjo were lower at the 12 cm seeding depth at all levels of soil matric potentials. The emergence rate was also reduced at the 8-cm seeding depth, but only at -30.0 bars. Seedling emergence of Shaneii was found to be lower than that of the Torsh and Zarjo cultivars. The rates of emergence of the cultivars were not greatly different at the various seeding depths. (Skogerboe-Colorado State)
W79-01718

A METHOD OF PROMOTING PENETRATION OF WATER INTO TIGHT, SLOPING SOIL UNDER DRIP IRRIGATION,
Massachusetts Univ., Amherst. Dept. of Plant and Soil Sciences.
D. Hillel.
Soil Science, Vol 125, No 5, p 329-330, May, 1978. 1 fig.

Descriptors: *Irrigation, *Infiltration, *Penetration, Runoff, Evaporation, Root zone, Gravels, Methodology, Drip irrigation.

A method is proposed to increase penetration of water into the root zone, as well as to reduce runoff and evaporation by means of gravel-filled pits under each emitter when drip irrigation is applied to sloping ground of low infiltrability. A sample calculation is provided to help determine the optimal dimensions of the gravel pits. (Skogerboe-Colorado State)
W79-01719

IRRIGATION TIMING-ITS INFLUENCE ON THE EFFECTS OF SALINITY AND WATERLOGGING STRESSES IN TOBACCO PLANTS,
Victoria Dept. of Agriculture, Tatura (Australia). Horticulture Research Station.
D. W. West, and J. D. F. Black.

Soil Science, Vol. 125, No. 6, p 367-376, June, 1978. 1 fig, 4 tab, 33 ref.

Descriptors: Saline water, Water quality, Sodium chloride, Drainage, Soil-water-plant relationships, Oxygen, *Irrigation, Diffusion, Growth chambers, *Tobacco, *Salinity, *Waterlogging.

The effects of irrigation timing on the interaction between salinity and waterlogging, and changes in the oxygen status in the root zone of a heavy soil under tobacco plants irrigated with drip system were studied. Water uptake was significantly reduced by the presence of NaCl in the root zone irrespective of irrigation and drainage treatment. Leaf chloride in all nonsalinized treatments was significantly lower than in all salinized treatments. Both day and night waterlogged saline treatments contained significantly higher leaf chloride than the nonwaterlogged saline treatment. The night-waterlogged saline treatment contained significantly lower leaf chloride than the day-waterlogged saline treatment. Similar trend to higher CL(-) content with day waterlogging was present with petioles and stems. Root CL(-) concentrations were relatively low irrespective of treatment. Leaf sodium concentrations were relatively low irrespective of treatment. Leaf sodium concentrations of day- and night-waterlogged saline treatments were significantly higher than all other treatments, and the day-waterlogged salinized plants had significantly higher leaf Nat than the night-waterlogged salinized plants. The results suggests that plants in a soil with some chance of being waterlogged in the root zone and with NaCl present in the root zone would benefit from being irrigated at night rather than during the day. (Skogerboe-Colorado State)

THE TIMELINESS BENEFIT OF SUBSURFACE DRAINAGE,
Soil Conservation Service, Kankakee, IL.
L. W. Wendte, C. J. W. Drablos, and W. D. Lembke.
Transactions of the American Society of Agricultural Engineering, Vol 21, No 3, p 484-488, May-June 1978. 6 fig, 3 tab, 21 ref. OWRT A-077-ILL(2).

Descriptors: *Subsurface drainage, *Agriculture, *Benefits, *Model studies, Mathematical models, Planting management, Drainage, Spring, Soils, Soil water, Economics, Time, Farm management, Drains, Subsurface drains, Tile drains.

A simulation model was developed to predict available spring workdays and the earliest possible planting dates for soils with a subsurface drainage system. Applying the model to two Illinois soils, it was found that as many as two available workdays in April and 19 days in May are gained by installing a recommended subsurface drainage system. The optimum drain spacing based on the timeliness benefit of earlier corn planting ranged from 24 to 61 m, depending on permeability and soil type. The average annual timeliness benefit for installing the optimum subsurface drainage system was $37 to $156/ha. (Sims-ISWS)
W79-01728

ROOT-SINK DESCRIPTIONS OF WATER SUPPLY TO DRYLAND WHEAT,
Agriculture Research Service, Pendleton, OR. Columbia Palteau Conservation Research Center.
R. W. Rickman, R. R. Allmaras, and R. E. Ramig.
Agronomy Journal, Vol. 70, No. 5, p 723-728, September-October, 1978. 11 fig, 13 ref.

Descriptors: Moisture uptake, *Wheat, *Moisture tension, *Soil water movement, Soil profiles, *Root distribution, Dry farming, Soil-water-plant relationships, Sink, Hydraulic conductivity, *Soil water potential.

Soil water content changes were supplemented with calculations of water flow between soil layers to provide an improved description of water uptake by dryland wheat (Triticum aestivum L.). Water content changes were estimated from neutron meter measurements. Soil water flux was estimated from field measurements of both hydraulic conductivity and hydraulic head gradients; unsaturated conductivity beyond the range of field measurement was calculated with the pore interaction model of Marshall matched to field measured values at 250 mb. Seasonal water-uptake patterns, determined by the root-sink description, differed from those shown by only water content measurements. Peak water-use rates did not coincide with maximum leaf area index, but coincided with the period from heading to completed head extension. Water flux in the profile was important for supplying water during grain filling and was critical in this layered soil, which restricted rooting to depths less than 150 cm. (Skogerboe-Colorado State)
W79-01732

DIFFERENCES AMONG GENOTYPES OF CORN IN THE KINETICS OF P UPTAKE,
Royal Veterinary and Agricultural Coll., Copenhagen (Denmark).
N. E. Nielsen, and S. A. Barber.
Agronomy Journal, Vol. 70, No. 5, p 695-698, September-October, 1978. 6 tab, 23 ref.

Descriptors: *Corn(Field), *Phosphorus, Simulation analysis, Soil properties, *Root systems, Correlation analysis, *Absorption, *Kinetics.

Many plant species utilize fertilizer or soil P inefficiently. A survey of 12 inbred corn genotypes (Zea mays L.) grown in water culture indicated a 1.8 to 3.3-fold variation in root weight, root length per unit of plant weight, root length per unit of root weight, and maximal net P influx. Some aspects of the role of genetics were elucidated by comparing the P absorption parameters of five inbreds with those of four single-cross hybrids made from these inbreds. Five single crosses were grown at low and high P levels in the field on a Raub silt loam (Aquic Argiudoll) to test the significance of the measured root parameters on P uptake. Plants were harvested 22, 38 and 51 days after planting. Phosphorus uptake was also simulated by a model using soil and plant root parameters related to P uptake. The correlation between predicted and observed P uptake was r2 = 0.90 for the 22 to 38-day time interval and r2 = 0.98 for the 22 to 51-day time interval. Hence, observed differences among corn single crosses in their plant root parameters were reflected in their P uptake when grown in the field. (Skogerboe-Colorado State)

Agronomy Journal, Vol. 70, No. 2, p 345-348, March-April, 1978. 9 tab, 7 ref.

Descriptors: *Tobacco, Potassium, *Fertilizers, Solubility, Nutrient removal, Sulfur, *Crop production, Sands, Soils.

Tobacco was grown for 5 years on Lakeland fine sandy soil, a soil which retains very little K. Split applications of K2SO4 were compared to single applications of K2SO4 and resin- polyvinyl-, and S-coated K materials. Yields and chemical composition of tobacco leaves and soil were used to measure the relative effectiveness of K treatments. Yields and K contents of tobacco leaves were increased by K fertilization. Split applications of K2SO4 were more effective than single applications at planting. In years with heavy rainfall, applying slowly-soluble sources all at planting was better than applying K2SO4 in split application. Potassium from slowly soluble materials was less readily leached than from K2SO4, resulting in higher concentration of K within 60 cm of the surface at the time of tobacco flowering. When various thickness of S were applied to give a range of K release, the thicker coatings gave higher yields. Treatments that provided higher K content increased total alkaloids and decreased reducing sugars in the first of the two years that they were measured. Application of K fertilizers with reduced solubility should assure good yields, quality and a high level of K in tobacco. (Skogerboe-Colorado State)

Soil Science Society of America Journal, Vol. 41, No. 1, p 127-131, January-February 1977. 5 fig, 1 tab, 9 ref. OWRT A-068-MO(4), 14-31-0001-4024 and 5025.

Descriptors: Root penetration, *Soil water, Water availability, Sawdust, Subsoiling, Liming, *Crop production, *Root systems, Soil profiles.

Root development and crop yields are greatly reduced in soils having fragipan layers because of restricted air and water movement, high bulk densities and soil strength, and high acidity. In the first year after soil profile modification by trenching of a Missouri Typic Fragiudalf, available water storage and yields of grain sorghum (Sorghum bicolor (L.) Moench) were increased. Within unmodified areas, sorghum yields averaged 1,841 kg/ha. Deep trenching without chemical or physical additives increased yields to 4,322 kg/ha. Mixing lime, fertilizer, and sawdust with the soil material within the trenches increased grain sorghum yields to 5,98 kg/ha. The sawdust significantly increased water storage and water extraction, resulting in the grain yield increase. Reexcavation of a pit used by the Soil Conservation Service for soil series identification of the Hobson soil showed no signs of soil density or strength reformation during the 16-year period since the pit was refilled.

EFFECT OF FERTILIZATION ON PENNCROSS CREEPING BENTGRASS,
Pennsylvania State Univ., University Park. Dept. of Agronomy.
D. V. Waddington, T. R. Turner, J. M. Duich, and E. L. Moberg.
Agronomy Journal, Vol 70, No. 5 p 713-718, 1978. 2 fig 7 tab 15 ref.

Descriptors: *Fertilization, *Turf grasses, Fertility, Productivity, *Nitrogen, *Phosphorus, *Potassium, Soil tests, *Bent grass.

A field study was conducted on fine, mixed soil to determine the effects of N sources (Agrinite, Milorganite, ureaform, and urea), P rates (0, 0.49, 0.98, and 1.95 kg/100 m2), and K rates (0, 0.76, and 1.52 kg/100 m2) on soil nutrient levels and the growth, quality, and chemical compostion of 'Penncross' creeping bentgrass (Agrostis palustris Huds.) maintained as putting green turf. Wilting, disease, chlorosis, and annual bluegrass (Poa annua L.) infestation were used to assess quality. Fertilization with Milorganite increased available soil P and Mg. Application of K increased both tissue and available soil K. However, a greater increase in soil K and a smaller increase in tissue K were obtained by the second additional increment of K than the first one. The greatest change in tissue K occurred with the first incremental addition of K

he greatest change in tissue P was not greatly fected by soil P above 24 ppm. Less severe mmer wilting was observed with Agrinite, Mirganite, and K treatments. Annual bluegrass insion was favored by P and K fertilization and e effect of one was enhanced by the other. ilorganite, which increased soil P, also favored nual bluegrass. (Skogerboe-Colorado State)

FFECTS OF CULTURAL PRACTICES ON RAIN YIELD OF IRRIGATED WHEAT,
rizona Univ., Tucson. Dept. of Plant Sciences.
D. Day, E. B. Jackson, and A. Alemu.
gronomy Journal, Vol. 70, No. 2, p 279-282, arch-April, 1978. 4 tab, 21 ref.

escriptors: *Wheat, Cultural control, *Nitrogen, ertilization, Crop production, Planting manageent, Beds, Irrigation, Arizona.

periments were conducted at Yuma, Arizona to dy the effects of N fertilizer treatment in combiion with methods of planting and row positions beds, on the yield and quality of wheat grain. N fertilizer treatments (34, 17 + 17, 68, 34 + 136, and 68 + 68 kg/ha), two methods of nting (on the flat and on beds), and four row sitions on beds (north, south, east, and west) re evaluated. Flat plantings resulted in higher eat grain yields than did bed plantings; however bed plantings produced higher grain volumeights. Within planting methods, N fertilizer atments did not significantly influence grain lds or grain volume-weights. Grain yield coments were similar for both planting methods. eat grown on beds with an east-west orientan produced more heads per unit area, more ds per head, and higher grain yields than did eat produced on beds oriented in a north-south ection. Wheat responded to N fertilization when wn on both flat and bed plantings during the ter months in the Southwest. (Skogerboe-Colo o State)

METHODOLOGY FOR TESTING THE ACRACY OF YIELD PREDICTIONS FROM ATHER-YIELD REGRESSION MODELS R CORN,
rdue Univ., Lafayette, IN. Dept. of Agronomy.
L. Nelson, and R. F. Dale.
ronomy Journal, Vol. 70, No. 5, p 734-740, tember-October, 1978. 5 tab, 21 ref.

scriptors: Statistical models, Technology, ather data, *Regression analysis, *Corn(Field), trogen, *Indiana, *Crop production, *Model dies.

alysis of variance (ANOVA) techniques were d to evaluate the accuracy of yield predictions corn in Indiana counties with four statistical dels: (1) Thompson approach, (2) modified mpson approach, with a nitrogen technology n, (3) a 1974 model by Leeper, Runge, and lker and (4) a 1975 model by Dale and Hodges. models (1), (2), and (4), separate versions were eloped with the particular series of weather corn yield data for each county. All models e used to predict yearly average corn yields for unty with data not used to fit the regression fficients. A significant difference among models detected by the ANOVA. Multiple comparitests indicated that regression models (2), (3), (4) were more accurate than model (1). This lt was attributed mainly to the handling of nology or the weather-technology interaction cts on corn yields. The trend variables used in del (1) acted to confound weather and technoleffects and create unstable regression models. ough the direct application of the results of study is limited to Indiana, the methodology testing the accuracy of yield prodictions is ved to have universal application. (Skogerboerado State)

MANAGEMENT OF IRRIGATED SOYBEANS ON A MODERATELY COARSE-TEXTURED SOIL IN THE UPPER MIDWEST,
North Carolina State Univ. at Charlotte. Dept. of Soil Science.
D. K. Cassel, A. Bauer, and D. A. Whited.
Agronomy Journal, Vol. 70, No. 1, p 100-104, January-February, 1978. 2 fig, 4 tab, 22 ref.

Descriptors: *Soybeans, Supplemental irrigation, Water management(Applied), Fertilization, Nitrogen, *Nitrates, Tensiometers, *Leaching, *Irrigation programs, *Crop production.

The objectives were to determine the yield potential of supplementally irrigated soybeans on moderately coarse-textured soils and to develop an irrigation schedule for efficient water management. The study, conducted on Maddock sandy loam from 1972 to 1974, employed a split-split plot design with water level as the main block and N fertility rates (0, 56, 112, and 224 kg/ha) as sub-plots. Water levels were W1 (dryland), W2 (under-irrigation), W3 (optimum) and W4 (over-irrigation). Sub-sub plots were planting dates in 1972 and cultivars in 1973 and 1974. Grain yields were significantly different for water levels during each of the 3 years. Three-year yield means were 543, 1,823, 2,428, and 2,164 kg/ha for W1, W2, W3, and W4, respectively. The application of 224 kg/ha N fertilizer in 1972 increased grain yield at the 0.95 probability level. An irrigation scheduling based upon tensiometers proved effective in applying irrigation water. Based upon results of this study, it was concluded that soybeans can be seriously considered as a crop to be included in cropping systems for irrigated, moderately coarse-textured soils in the Upper Midwest. (Skogerboe-Colorado State)

EFFECTS OF CORN STOVER, MANURE, AND NITROGEN ON SOIL PROPERTIES AND CROP YIELD,
Guelph Univ. (Ontario). Dept. of Land Resource Sciences.
J. W. Ketcheson, and E. G. Beauchamp.
Agronomy Journal, Vol. 70, No. 5, p 792-797, September-October, 1978. 4 fig, 8 tab, 6 ref.

Descriptors: *Nitrogen, *Fertilizers, *Corn(Field), *Organic matter, Farm wastes, Soil properties, Crop response, Soil treatment, *Crop production.

Residues and farmyard manures are considered important in determining the N fertilizer requirement of crops. This relationship was studied in a 10-year field experiment on a Typic Hapludalf soil (pH 7.8). Five levels of fertilizer N were applied annually with three management treatments which included (1) returning the stover produced by the preceding corn (Zea mays L.) crop, (2) poultry manure equivalent to 112 kg N/ha/year and (3) no stover returned or manure applied. Dry matter yields and N in grain and stover were measured each year. In general, the manure treatment without N fertilizer gave yields comparable with any other treatment. Where fertilizer N was applied, stover resulted in slightly higher yields than where stover was removed. Stover returned to the soil did not increase fertilizer N requirements at normal rates of application. It was concluded that corn stover residue did not affect the N fertilizer requirement of this soil for grain corn production. Annual applications of liquid poultry manure, containing N equivalent to 112 kg/ha, precluded a requirement for fertilizer N. (Skogerboe-Colorado State)
W79-01781

FERTILIZER PLACEMENT EFFECTS ON SOYBEAN SEED YIELD, N2 FIXATION, AND 33P UPTAKE,
lMinnesota Univ., St. Paul. Dept. of Soil Science.
G. E. Ham, and A. C. Caldwell.
Agronomy Journal, Vol. 70, No. 5, p 779-783, September-October, 1978. 2 fig, 4 tab, 20 ref.

Descriptors: *Nitrogen fixation, *Soybeans, *Phosphorus, Radioisotopes, *Fertilizers, Ureas, Seeds, Productivity, *Crop production, *Absorption.

This study was planned to evaluate the efficiency of P fertilizer utilization by field-grown soybeans with different fertilizer placements using 33P labelled fertilizer (35 kg P/ha) on a Waukegan silt loam soil (Typic Hapludoll) low in plant available N and P. In addition, urea (30 kg N/ha) labelled with 15N was added to measure the effect of P fertilizer placement on N uptake and N2 fixation using the 'A' vaue concept concerning the measurements of available soil nutrients developed by Fried and Dean (1952). Soybean seed yield and total P uptake were increased significantly by adding P fertilizer with no differences among the fertilizer placements (seed yield ranged from 3,811 to 4,035 kg/ha compared to 3,200 kg/ha for the control). The 33P labelled fertilizer provided a direct, quantitative measure of the efficiency of plant use of the added P and provided a basis of evaluating the fertilizer placements without the hazards associated with 33P over the 149-day experiment. The 'A' value concept provided a reliable estimate of N2 fixation which agreed with Kjeldahl measurements. (Skogerboe-Colorado State)

RELATIONSHIP BETWEEN SOIL TEST AND SMALL GRAIN RESPONSE TO P FERTILIZATION IN FIELD EXPERIMENTS,
South Dakota State Univ., Brookings. Dept. of Plant Science.
P. E. Fixen, and P. L. Carson.
Agronomy Journal, Vol. 70, No 5, p 838-844, September-October, 1978. 3 fig, 8 tab, 35 ref.

Descriptors: *Soil tests, *Fertilization, *Phosphorus, *Grains(Crops), Correlation analysis, Regression analysis, Climatic data, Soil properties, Crop response, Organic matter.

Yield data from 74 small grain field experiments over a 13-year period were used to evaluate the relationship between various soil tests and P response. The soil tests examined in this study were the Bray 1 (soil to solution ratio of 1:7, 1:10, 1:20, and 1:50), Olsen P, and P sorption index of Bache and Williams. The crop species included were Triticum aestivum L., Hordeum vulgare L., and Avena sativa L. The highest correlation between soil test value and yield response to P fertilization was found with the Bray 1, 1:50 ($r2 = 0.41$). An additional 23 percent of the yield response variation could be explained by including six additional variables in a multiple regression analysis employing dummy variables. The r value between P sorption index and yield response on alkaline dummy variables. The r value between P sorption index and yield response on alkaline soils was -0.70 but was near zero for acid soils. Differences were also noted in degree of response between parent materials and crop species. Organic matter content appeared to influence response on some soils. (Skogerboe-Colorado State)

DIFFERENTIAL RESPONSE OF SOYBEAN VARIETIES TO SOIL CADMIUM,
Illinois Univ. at Urbana-Champaign. Dept. of Agronomy.
S. F. Boggess, S. Willavize, and D. E. Koeppe.
Agronomy Journal, Vol. 70, No. 5, p 756-760, September-October, 1978. 1 fig, 5 tab, 30 ref.

Descriptors: *Cadmium, Toxicity, *Soybean, Varieties, *Crop response, Sewage sludge, Soil amendments, Trace elements.

The results are presented of a comprehensive survey of the Cd uptake and effect by a number of the prominent soybean (Glycine Max (L.) Merrill) varieties grown on several CdC12 or sewage sludge-amended soils in the glasshouse. In all varieties, Cd toxicity symptoms appeared as a continuum form slight effects observed as a red, red-brown, or puple coloration at the junction of the leaf blade and tetiole, to severe leaf curling and extensive reddening of the leaf veins, chlorosis, and finally a brittle condition followed by abscission of the leaves. All varieties showed increased shoot Cd concentration and decreased dry weight in response to soil CdC12, but varietal differences in the severity of these Cd effects were observed. Further analysis of data for Cd susceptibility suggested that, of the soybean varieties tested on CdC12-ammended soils, Dunfield, Harosoy, Arksoy, Dare, Flambeau, and Scioto were generally the most susceptible while Clark, Mandarin, Munkden, Jackson, and Lee were consistently ranked as less susceptible (Skogerboe-Colorado State).

INCENTIVES FOR IMPROVED WATER-USE EFFICIENCY: IMPLEMENTATION PHASE,
Abt Associates Inc., Cambridge, MA.
L. C. Kerpelman, B. L. Gettleman, and B. E. Rovin.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-269 524, Price codes: A08 in paper copy, A01 in microfiche. Submitted to Idaho Department of Water Resources, August 1976, 162 p, 39 tab.

Descriptors: *Water resources, *Water conservation, *Water use, *Water management(Applied), *Irrigation, Methodology, Testing procedures, Conservation, Gross income, Farm practices, Water allocation(Policy), *Idaho, *Incentives, Pacific Northwest, Survey data.

This report identifies and measures the relative effects of the legal, institutional, social, and economic factors affecting water conservation and management. These effects are measured in hopes of describing and structuring an incentive program to reduce water use. The most important factor in the state of Idaho concerning water conservation is the management practices and attitudes of farm operators. The report develops measures to assess farm operators' attitudes, water and farm management practices, and reactions to possible water-conservation incentives. The primary data-gathering methods were the Farm Operator Survey, Water-Use Efficiency Ratings, and a Water Organization Survey. The farmers' characteristics discussed in relation to their water conservation attitudes were age, region in which farming took place, income, type of on-farm irrigation system, and water delivery instrumentality. The report presents recommendations concerning which target groups of farmers should be concentrated upon, the structure of incentive programs, how to appeal to the target groups, the medium through which incentive programs are presented to farm operators and the role of water organizations. This report provides a planning basis for the Idaho Department of Water Resources to meet the water resource needs of Idaho citizens. (Coan-NC)

NITROGEN RELEASE CHARACTERISTICS OF ISOBUTYLIDENE DIUREA AND ITS EFFECTIVENESS AS A SOURCE OF N FOR FLUE-CURED TOBACCO,
North Carolina State Univ. at. Raleigh. Dept. of Soil Science.
G. S. Miner, J. P. Lilly, and D. L. Terry.
Agronomy Journal, Vol. 70, No. 3, p 434-438, May-June, 1978. 3 fig, 3 tab, 12 ref.

Descriptors: *Nitrogen, Leaching, *Tobacco, Nutrient remova, Fertilizers, Particle size, *Ureas.

The objectives of this study were to investigate the release characteristics of isobutylidene diurea (IBDU), with N-release characteristics dependent primarily upon the effects of particle size on chemical dissolution rather than the effects of environmental variations on biological activity, in laboratory and greenhouse studies and to evaluate it as a source of N for flue-cured tobacco in the field. Urea, $NaNO_3$, and four particle sizes of IBDU (1.05, 0.75, 0.55, and 0.40 mm) were applied at rates of 200 and 400 mg M per kg of soil to a Norfolk sandy loam (Typic paleudult) in lysimeters and subjected to leaching at 10 invervals over a 109-day period. Percentage removal of N from these sources were observed at different leaching time. The effects of particle size of IBDU on dry matter and N uptake were studied to determine their N release characteristics. IBDU particle sizes of 1.05 and 0.40 mm were compared with $NaNO_3$ and Urea as N sources for flue-cured tobacco. (Skogerboe-Colorado State)

EVALUATION OF NITRAPYRIN AS A MEANS OF IMPROVING N EFFICIENCY IN IRRIGATED SANDS,
Wisconsin Univ.-Madison. Dept. of Soil Science.
L. L. Hendrickson, D. R. Keeney, L. M. Walsh, and E. A. Liegel.
Agronomy Journal, Vol. 70, No. 5, p 699-703, September-October, 1978. 3 fig, 5 tab, 24 ref.

Descriptors: *Nitrification, Inhibitors, *Nitrogen, Ammonia, Nitrates, Fertilizers, *Potatoes, *Leaching, Osmotic pressure, *Nitrapyrin.

The objective of this research was to determine if optimum levels of N might be maintained throughout the growing season by delaying nitrification with a nitrification inhibitor, Nitrapyrin. Several field experiments were conducted on a Plainfield loamy sand involving various N sources, rates, and times of application with and without Nitrapyrin. Potato tuber yield and the forms and distribution of N in and below the fertilizer bands were determined. Nitrapyrin extended the persistence of applied NH_4 in all experiments, but inhibition of nitrification was of relatively short duration. Nitrapyrin persistence was likely reduced by the more rapid volatilization and hydrolysis in sandy soils. Further, the effectiveness of Nitrapyrin was likely limited by rapid leaching NH_4 out of the Nitrapyrin-treated zone. Application of Nitrapyrin reduced both total tuber yield and the proportion of marketable tubers. The soil sampling data showed that Nitrapyrin maintained a much higher NH_4-N/NO_3-N ratio than comparable nonnitrapyrin treatments. It appears that the predominance of NH_4-N interfered with plant metabolism so that both yield and normal development of tubers were impaired. (Skogerboe-Colorado State)
W79-01847

EFFECTIVENESS OF NITRAPYRIN IN CONTROLLING NITRIFICATION OF FALL AND SPRING-APPLIED ANHYDROUS AMMONIA,
Wisconsin Univ.-Madison. Dept. of Soil Science.
L. L. Hendrickson, L. M. Walsh, and D. R. Keeney.
Agronomy Journal, Vol. 70, No. 5, p 704-708, September-October, 1978. 4 tab, 18 ref.

Descriptors: *Nitrification, Inhibitors, *Denitrification, *Nitrogen, Ammonia, Fertilizers, Crop response, *Corn(Field), Nitrapyrin.

Fertilizer N applied in the fall for the next growing season is often less efficient than N applied closer to the time of plant use. Efficiency might be greatly improved by maintaining the N as NH_4, through the use of nitrification inhibitor, Nitrapyrin (2-chloro-6 (trichloromethyl) pyridine). To evaluate this hypothesis, field trials were established during 1975 to 1977 in south central Wisconsin using 84 to 168 kg/ha N applied as anhydrous ammonia with and without 0.55 kg/ha Nitrapyrin. The results indicated that while nitrification can be significantly slowed by application of nitrapyrin, a yield response does not result. It was thought that a response might have been obtained had a crop been grown on the poorly-drained area adjacent to the harvested area since appreciable N appeared to have been denitrified at this site. Nitrification inhibition by nitrapyrin varied widely within the same field. The results illustrated the problems involved in predicting whether nitrapyrin application will be effective in reducing nitrogen losses and increasing yields. (Skogerboe-Colorado State)
W79-01849

TRICKLE EMITTER FOR SUBTERRANEAN IRRIGATION,
R. W. Spears.
U.S. Patent No. 4,100,940, 6 p, 6 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 972, No 3, p 1006, July 18, 1978.

Descriptors: *Patents, *Irrigation, *Irrigation systems, *Subsurface irrigation, Application equipment, Irrigation efficiency, Drip irrigation.

An irrigation pipeline has emitters equipped with discharge nipples for engagement by flexible hoses to release water at a trickle rate at selected subterranean locations within the radii of the hoses. The nipples may be integral with a plastic manifold that is installed between confronting pipe ends and some of the nipples may be blind nipples that are sheared for activation of the emitters as required to meet increased demand for water. One object of the invention is to increase the width of the area that can be irrigated. Another object of the invention is to make the emitter capable of releasing water into the soil at any desired depth including depths below the level of the pipeline instead of the release being limited to levels above the level of the pipeline. This capability makes it unnecessary to bury the pipeline at a depth below the level at which the water is to be released. (Sinha - OEIS)
W79-01860

MASTER-SATELLITE IRRIGATION CONTROL SYSTEM WITH REMOTE PROPORTIONAL TIMING,
Clemar Mfg. Corp., Glendora, CA. (Assignee).
R. L. Ryggles, and V. Panday.
U.S. Patent No. 4,101,786, 13 p, 9 fig, 4 ref; Official Gazette of the United States Patent Office, Vol. 972, No 3, p 1266, July 18, 1978.

Descriptors: *Patents, *Irrigation, *Irrigation systems, *Irrigation efficiency, Water control, Control systems, Remote control, Instrumentation, Timing, Rates of application, Electronic equipment.

An apparatus and a related method are described for proportionately varying from a master unit the durations of irrigation at valve stations controlled by a number of satellite units. Control signal for starting a programmed sequence of valve operations at all of the satellites in a selected one of two groups of satellites, or for resetting all of the satellites to a 'home' postion are transmitted over a single pair of wires. One embodiment of the invention includes adjustable timing circuitry in the master unit to generate a timing signal which is transmitted to the satellite units over a separate wire, and is utilized to vary the duty cycle of a station timing motor which measures the durations of irrigation. In an alternate counter, and the irrigation times at all of the stations can be varied to the same degree by adjustment of a variable-frequency pulse generator at the master unit. (Sinha - OEIS)
W79-01861

FLOW CONTROL DEVICE FOR AN IRRIGATION DITCH,
Rhode (Richard), Glasgow, MT. (Assignee).
G. L. Graham.
U.S. Patent No. 4,103,495, 4 p, 4 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 973, No 1, p 57, August 1, 1978.

Descriptors: *Patents, *Irrigation, *Irrigation ditches, *Flow control, Irrigation efficiency, Irrigation practices, Water distribution(Applied), Conduits.

A device is described for controlling the flow of water between an irrigation ditch and an adjacent

d. A conduit has a first end opening into the gation ditch and a second end opening into the d to be irrigated. The cover is pivotally at- hed to the first end of the conduit by means of a shaped hinge. A handle is provided on the erior of the cover and can be engaged by a nually-held instrument to pivot the cover to a sition above the conduit where it will rest due to configuration of the hinge part. The conduit is sitioned relative to the irrigation ditch such that first end is recessed inwardly of one side wall the ditch and extends below the bottom wall of ditch. (Sinha-OEIS)

TARY SPRINKLER IMPACT ARM SPRING JUSTMENT,
sco Industries, Dallas, TX. (Assignee).
C. Ridgway.
. Patent No. 4,103,828, 9 p, 8 fig, 6 ref; Official zette of the United States Patent Office, Vol , No 1, p 170-171, August 1, 1978.

scriptors: *Patents, *Irrigation, *Sprinkler irri- ion, *Application equipment, Water delivery, gation efficiency, Irrigation practices.

rotary sprinkler is provided with structure for usting the force applied to the impact arm by impact arm spring. The sprinkler has a laterally ected nozzle cooperating with the arm to rotate nozzle and an impact arm journaled on a shaft ending above the nozzle. The arm is mounted hin a cage extending above the nozzle. The e includes a pair of arms extending from the zle on opposite sides of the shaft and terminat- at their upper ends remote from the nozzle in a plate. A helical spring surrounds the shaft and ecured at its lower end to the arm. A bushing mbly is mounted in the top plate of the cage receives the top end of the spring. The bushing mbly may be manually adjusted relative to the plate to vary the force applied by the spring to impact arm. The sprinkler is mounted in a ket-like housing positionable within the ground n that the mouth of the housing is flush with ground surface. The sprinkler responds to the age of water through the nozzle by rising from wer first position retracted in the housing to a ed second position out of the housing. A top er sized to mate with the mouth of the housing ttached to the top plate of the cage such that n the sprinkler is in the first position the top er mates with the mouth of the housing to ose the sprinkler. (Sinha-OEIS)

FORAGE YIELD AND FERTILIZER RECOVERY BY THREE IRRIGATED PERENNIAL GRASSES AS AFFECTED BY N FERTILIZATION,
Agricultural Research Service, Boise, ID. Northwest Water Research Center.
C. L. Hanson, J. F. Power, and C. J. Erickson.
Agronomy Journal, Vol. 70, No. 3, p 373-375, May-June, 1978. 3 tab, 5 ref.

Descriptors: *Forage grasses, Hay, Nitrogen, *Fertilization, Crop response, South Dakota, Clays.

The purpose of this study, conducted in western South Dakota on heavy clay soils was to determine forage yield responses and N recovery of three irrigated grasses--reed canarygrass, garrison creeping foxtail, and smooth brome--to single and split N applications. Single N treatments consisted of 0, 56, 112, 224, or 448 kg N/ha applied in March. For the split N applications, these same rates were applied both in March and again after the first hay cutting. Forage yields were maximunm when the grasses were fertilized with 224 kg N/ha in the split applications. First cutting forage N percentage varied between 0.8 to 2.8 for N rates of 56 kg N/ha and above. The percentage of N was highest, frequently over 3%, in second cutting forage from treatments receiving split fertilizer applications. Percent total N recovered increased as fertilizer applications. Percent total N recovered increased as fertilizer rate increased when all N was applied in March, but recovery was highest for the split application of 224 kg N/ha. (Skogerboe-Colorado State)
W79-01885

NITROGEN LOSSES FROM SPRINKLER-APPLIED NITROGEN FERTILIZER,
Nebraska Univ., North Platte. Dept. of Agronomy.
G. W. Hergert.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-289 364, Price codes: A04 in paper copy, A01 in microfiche. Nebraska Water Resources Center, University of Nebraska, Lincoln, Project Completion Report, September 1978, 47 p, 6 fig, 28 tab, 11 ref. OWRT A-045-NEB(1), 14-34-0001-8029.

Descriptors: *Nitrogen, *Fertilizers, Irrigation, *Nitrates, Water quality, *Sprinkler irrigation, *Irrigation practices, *Fertilization, Soil treatment, Water pollution control.

The objective was to examine nitrogen fertilization and irrigation practices on sandy soils with the goal of quantifying losses of nitrogen from sprinkler-applied nitrogen fertilizer. No significant effect of two different irrigation levels or two nitrogen sources on dry matter accumulation or grain yield was shown. The lack of a treatment effect from the irrigation treatments is encouraging because it indicates that optimum corn yields may be obtained with somewhat limited water application. The nitrate-nitrogen concentration in extracted soil water was high. Average nitrate-N concentrations in deep percolating soil water ranged between 70 and 107 ppm. Nitrate-N accounted for essentially all of the leached mineral nitrogen. Leaching losses in 1976 were 26 and 187 kg N/ha for the low and excess irrigation treatments, respectively. Losses in 1977 were 101 kg N/ha and 127 kg N/ha for the low and excess treatments. No appreciable volatilization of nitrogen from the sprinkler applied nitrogen fertilizer occurred. The development of management practices to limit groundwater enrichment with nitrate entails a complete understanding of realistic crop yield potentials, nitrogen requirements for that yield goal and proper water management to insure minimal leaching losses of nitrogen. Detailed management guidelines are discussed.

Texas Water Resources Institute, Texas A&M University, Technical Report No. 98, September 1978, 63 p, 17 tab, 38 ref. OWRT A-037-TEX(3), 14-34-0001-7091, 7092 and 8046.

Descriptors: *Energy costs, Efficiency, *Irrigation, Groundwater, Pumping, Irrigation distribution, Linear programming, Simulation analysis, *Texas, *Economic impact, Irrigation practices, *Model studies, Irrigation efficiency, Irrigation water, *Texas High Plains, *Texas Trans Pecos, Irrigated agriculture, Temporal analysis.

Results derived from three models to evaluate expected effect of increasing fuel price, fuel curtailment and risk are presented for the Texas High Plains and Trans Pecos. Increasing natural gas price could reduce the value of groundwater by 50 percent. In the Trans Pecos, with the assumption that energy prices would rise faster than crop prices, average economic life expectancy of a typical farm is estimated to be about five years. Implication of rising natural gas price is dramatic and emphasizes the serious need to become more efficient in use of irrigation water. Annual savings resulting from improved efficiency in pumping and applying irrigation were estimated to be several million dollars.

RADIATION AND ENERGY BALANCE OF SPRINKLER AND TRICKLE IRRIGATED FIELDS,
Ben-Gurion Univ. of the Negev, Beersheba (Israel). Inst. of Soil and Water.
J. Ben-Asher, M. Fuchs, and D. Goldberg.
Agronomy Journal, Vol 70, No 3, p 415-417, May-June, 1978. 1 fig, 2 tab, 13 ref.

Descriptors: Water conservation, *Sprinkler irrigation, Tomato, Evaporation, *Evapotranspiration, Energy budget, *Radiation, *Albedo, *Trickle irrigation.

Water conservation claims in favor or trickle irrigation are poorly documented. The radiation and energy balance of tomatoes grown on sand dune soil and on bare soil irrigated by sprinkling and trickling were compared. Under trickle irrigation, the average ratio of five energy balance measurements of evapotranspiration over evaporation pan (Class A) was 0.3, compared with 0.60 obtained under sprinkler irrigation. The comparison of radiation balance over the trickle and sprinkler irrigated plots indicates that the increased radiant heat loss and albedo from the dry portion of the trickle irrigated plot decreases the available evaporative energy at ground level. The smaller radiant heat load combines with the resistance of the dry soil to water flux to reduce the evaporation of the trickle irrigated plot. (Skogerboe-Colorado State)

SUNFLOWER YIELD AND WATER USE AS INFLUENCED BY PLANTING DATE, POPULATION, AND ROW SPACING,
Agricultural Research Service, Mandan, ND. Northern Great Plains Research Center.
J. Alessi, J. F. Power, and D. C. Zimmerman.
Agronomy Journal, Vol 69, No 3, p 465-469, May-June, 1977. 4 fig, 4 tab, 8 ref.

Descriptors: Crop response, *Crop production, Temperature, Agriculture, North Dakota, *Sunflowers, *Cultivation.

Sunflower has only recently been grown commercially as an oilseed crop in the drier regions of the Northern Great Plains. This study was conducted to acquire preliminary information on seed yield, oil concentration, and water use for oil-type sunflower as affected by planting date, plant population, and row spacing; and to obtain an indication how these results were affected by yearly variation in precipitation and air temperature. 4. WATER QUANTITY MANAGEMENT AND CONTROL

4A. Control Of Water On The Surface

INFORMATION FOR RESERVOIR CONTROL IN THE NORTHUMBRIAN WATER AUTHORITY,
Northumbrian Water Authority, Gosforth (England). Directorate of Planning and Scientific Services.
J. Edwards, and P. Johnson.
Journal of the Institution of Water Engineers and Scientists, Vol. 32, No. 3, p 207-216, May 1978. 7 fig, 2 tab, 1 ref.

Descriptors: *Reservoir operation, *Water supply, *Water management(Applied), *Water control, Water resources, Hydrology, Markov processes, Planning, Foreign research, Methodology, Reservoir releases, Regulation, Reservoir storage, Water yield, Reservoir yield, Risks, Droughts, *Great Britain.

A method of deriving information for control of reservoirs during normal conditions or a drought was proposed. The method is based on assigning a Markov Chain structure to reservoir monthly inflows. The method was demonstrated to give useful results for direct supply or river regulating reservoirs. The sensitivity of the method to the acceptable reliability of supply and the relationship between the reservoir release rate, the refill characteristics of the reservoir, and the supply planning horizon were discussed. The inaccuracies in the theory and the data used for the method were outlined. Conversion of control information into control rules was seen as the next development. It is the choice of acceptable risk which will eventually govern control rules. Since this is related to the value of water, it will be necessary to represent the value in some measurable form, and to incorporate with it in a unified objective function three important features associated with failing to meet demand: (1) restriction of supply beyond a nominal threshold beyond which restriction becomes a major disturbance; (2) duration of this restriction; and (3) frequency of its occurrence. The form of this function and how it reflects on control strategy are matters for further investigation. (Humphreys-ISWS)

WATER RESOURCES PLANNING FOR RIVERS DRAINING INTO MOBILE BAY,
Alabama Univ., University. Dept. of Chemical and Metallurgical Engineering.
G. C. April, D. O. Hill, H-A. Liu, S. Ng, and S. E. Slocovich.
Available from the National Technical Information Service, Springfield, VA 22161 as N77-15473, Price codes: A07 in paper copy, A01 in microfiche. Report BER 209-112, December 1976. 128 p, 52 fig, 23 tab, 14 ref. NAS 8-29100.

Descriptors: *Alabama, *Planning, *Water resources, *Mathematical models, *Computer models, *Water quality, *Estuarine environment, Remote sensing, Mixing, Intertidal areas, Saline water-freshwater interfaces, Sediment transport, Hydrology, Water pollution, Salinity, Coliforms, Flow rate, Hydrodynamics, *Mobile Bay(Ala), Physio-chemical processes.

Due to the continuing interest in the application of remote sensing, automatic data processing, modeling, and other aerospace related technologies to hydrological engineering and water resources management, an investigation was made that included major hydrological and water resource emphasis for the entire river drainage system which feeds the Mobile Bay estuary, Alabama. The adaptation and implementation of existing mathematical modeling for the purpose of describing the behavior of Mobile Bay were investigated. Of particular importance are the interactions that system variables such as river flow rate, wind direction and speed, and tidal state have on the water movement and quality within the bay system. Programs for the digital computation of these models require minimum effort for utilization. Predictive capabilities are consistent with expectations and are adequate for trend analysis. These analyses may include the assessment of man's activities on bay behavior. (Lardner-ISWS)

SUMMARY REPORT OF THE PILOT STUDY PROGRAM, GREAT LAKES SHORELAND DAMAGE STUDY,
Corps of Engineers, Chicago, IL. North Central Div.
L. D'Alba, and T. Hempfling.
Available from the National Technical Information Service, Springfield, VA 22161 as ADA-031 101, Price codes: A07 in paper copy, A01 in microfiche. Final Report, May 1976. 110 p, 12 fig, 54 tab, 3 ref.

Descriptors: *Great Lakes, *Lake shores, *Erosion, *Lake Michigan, *Lake Huron, *Lake Superior, *Lake Ontario, Shore protection, Damages, Erosion control, Lakes, Bank erosion, Beach erosion, Surveys, Data collections, Data processing, On-site investigations, Economics, Costs, Benefits, Sampling, Flood damage, Statistical methods, Shores, Coasts, Model studies, Cost-benefit analysis, Damages, *Coastal zone management, Pilot study program.

This report described the results of a pilot study of damages in 11 Great Lakes counties for the high water period 1972-1974. The purpose of the pilot program was to develop a reliable and inexpensive reconnaissance data collection method, to initiate coordination between the Corps of Engineers and responsible state and local agencies, and to gather the damage data for the 11 counties. The pilot program helped demonstrate how to streamline some of the data collection methods and pointed out ways to substitute for or eliminate other activities. Total damages resulting from the 1972-1974 high water period seem to be in the magnitude of two to three greater (after adjusting for price level changes and development) than damages for the 1951-1952 period for the 11 counties studied. The most significant conclusion that can be made is that it is not possible to make a comprehensive factual survey and evaluation of shoreline processes, effects, and damages without adequate funds, technical staff, and a suitable time framework for conduct of the study. Data collections for this study are published in 9 appendixes. (See W79-01529 thru W79-01534; W77-10904 and W77-10905) (Humphreys-ISWS)

GREAT LAKES SHORELINE DAMAGE SURVEY, SAINT LOUIS COUNTY, MINNESOTA, APPENDIX I.
Arrowhead Regional Development Commission, Duluth, MN.
Available from the National Technical Information Service, Springfield, VA 22161 as ADA-031 262, Price codes: A07 in paper copy, A01 in microfiche. Prepared for Army Corps of Engineers, Chicago, Ill., North Central Div., Final Report, May 1976. 106 p, 17 tab, 2 ref, 4 append. DACW 23-75-C-0023.

Descriptors: *Great Lakes, *Minnesota, *Lake Superior, *Lake shores, *Erosion, Surveys, Land use, Shore protection, Property values, Flood damage, Beach erosion, Bank erosion, Data collections, On-site investigations, Water quality, Lakes, Coasts, Damages, *Saint Louis County(Minn), Pilot study program.

This is a report of a study of St. Louis County, Minnesota, where shoreland damages were caused by or directly related to the 1972-1974 high water period on the Great Lakes. The report covered one of 11 county pilot studies initiated around the Great Lakes to study shoreland damage. Damage information, consisting of personal and real property loss and their associated costs, has been documented based on self-administered assessments, personal interviews, and field reconnaissance. St. Louis County's North Shore riparian owners were cooperative and eager to provide information. The response rates to survey instruments was 67% for residential owners and 65% for non-residential parcel owners. About two-thirds of the residential and non-residential parcels have been subject to either erosion or flooding during the two year study period. Aerial photo mosacis of county shorelands were included. (See W79-01528) (Humphreys-ISWS)

GREAT LAKES SHORELINE DAMAGE SURVEY; BROWN, DOUGLAS, AND RACINE COUNTIES, WISCONSIN, APPENDIX II,
Wisconsin Univ.-Milwaukee. Center for Great Lakes Studies.
N. P. Lasca, R. G. Pirie, P. C. Tychsen, and G. A. Fowler.
Available from the National Technical Information Service, Springfield, VA 22161 as ADA-031 263, Price codes: A16 in paper copy, A01 in microfiche. Final Report, May 1976. 259 p, 11 fig, 79 tab, 1 ref, 79 plates. DACW 23-75-C-0028.

Descriptors: *Great Lakes, *Wisconsin, *Lake Michigan, *Lake Superior, *Lake shores, Surveys, Erosion, Shore protection, Bank erosion, Flood damage, Beach erosion, Data collections, On-site investigations, Coastal structures, Costs, Sea walls, Retaining walls, Groins(Structures), Damages, *Brown County(Wis), *Douglas County(Wis), *Racine County(Wis), Pilot study program.

This report is a study of Brown, Douglas, and Racine Counties, Wisconsin, where shoreland damages were caused by or directly related to the 1972-1974 high water period on the Great Lakes. The 41 miles of shoreline bordering Brown County on Green Bay are prone to both flooding and bluff erosion. Approximately 1/2 of the shoreline, the shore west of the Fox River, is primarily affected by flooding, while the remaining half, the shore east of the Fox River, is primarily affected by water wave erosion of the low-lying to moderately high bluffs. Bluff recession along the Douglas County shoreline is highly variable, ranging from 38 to 239 feet during the period 1938 to 1973. The mean rate of shore retreat was 95.3 feet during the 35-year period. Virtually the entire length of Racine County's 15 miles of shore suffered damage to some degree in the period Labor Day 1972 to Labor Day 1974 through the erosive action of high storm waves developed on an unusually high lake surface. Aerial photo mosaics of county shoreland also were included. (See also W79-01528) (Humphreys-ISWS)

his report is a study of Oswego County, New ork, where shoreland damages were caused by or rectly related to the 1972-1974 high water period the Great Lakes. The shoreline is primarily in ivate ownership and land values are generally w due to the predominance of seasonal resinces and undeveloped land. The entire shoreline s been impacted by flooding and erosion. The agnitude depended primarily on land form and d use. Damages occurred over the entire shoree. The majority were sustained by seasonal resinces and commercial and industrial users. The ost severe damages were to grounds and imovements for seasonal residences and net busiss losses for commercial and industrial uses. The dings of this study reflect that information on mage to structures and physical property is ailable. Information on the impact on the natural vironment of erosion and flooding accompanyg high lake levels is not available. Aerial photo osaics of county shorelands also were included. ee also W79-01528) (Humphreys-ISWS)

escriptors: *Great Lakes, *Lake Michigan, Michigan, *Bank erosion, *Lake shores, Surveys, osion, Measurement, On-site investigations, ata collections, Aerial photography, Methodolo, Erosion rates, Beach erosion, Terrain analysis, otogrammetry, Data processing, Remote sensg, Analytical techniques, *Muskegon unty(Mich), Pilot study program.

his report evaluated the usefulness of aerial phographs in the determination of coastal erosion es. The effectiveness of aerial photographs was amined in terms of availability, type of coverage, and the reliability of the measurements obtained from the photographs. The methods employed were designed to minimize measurement errors by using an accurate measuring instrument and by taking the mean value of three measurements. Tilt errors were minimized by using ground distances to determine photo scales near each site. Relief displacement errors were corrected for where needed, and measurements with location errors were noted. Location errors are considered the most critical because they can not be minimized. The most accurate methods for recession studies would require first order plotting instruments using advanced photogrammetric techniques. The costs involved would by far outweigh any practical application of the information. Only 'ball park' values of rates can be obtained under two possible situations using the methods outlined: when a great deal of erosion occurs over a short period of time, or when measurements are made over a long time interval. Indications of rapid recession over a short time interval usually can be detected by simple observation of the aerial photographs. (See also W79-01528) (Humphreys-ISWS)
W79-01533

COMPARISON OF FIELD DATA COLLECTIONS TO DATA COLLECTED USING STUDY INSTRUMENTS IN MUSKEGON AND MANISTEE COUNTIES, MICHIGAN, APPENDIX VIII,
Michigan Univ., Ann Arbor. Coastal Zone Lab.
J. M. Armstrong, M. R. McGill, and J. F. Gillette.
Available from the National Technical Information Service, Springfield, VA 22161 as ADA-031 261, Price codes: A02 in paper copy, A01 in microfiche. Final Report, May 1976. 6 p, 4 tab. DACW 23-75-C-0027.

Descriptors: *Great Lakes, *Erosion, *Michigan, *Data processing, *Lake shores, Statistical methods, On-site data collections, Analytical techniques, Analysis, Distance, Height, Dimensions, Value, Property values, Real property.

The Coastal Zone Laboratory conducted tests in Muskegon and Manistee Counties to compare homeowner perceptions reflected in the self-administered damage assessment with independent measurements. Data were collected and compared from a sample of homeowners in the following categories: present property worth, bluff height, and the distance from the bluff edge to the foundation of the house. These parameters were chosen because they typify homeowners perceptions of monetary value, vertical distance, and horizontal distance. Results of statistical analysis were tabulated. OPTIMAL REGULATION POLICIES FOR A MULTIPURPOSE RESERVOIR WITH SEASONAL INPUT AND RETURN FUNCTION,
California Univ., Los Angeles. Dept. of System Science.
S. Arunkumar.
Journal of Optimization Theory and Applications, Vol. 21, No. 3, March 1977, p 319-328. 1 fig, 4 ref. (California Water Resources Center Project UCAL-WRC-W-341). OWRT A-043-CAL(3).

Descriptors: *Storage theory, Dynamic programming Water resources, Reservoirs, *Multipurpose reservoirs, *Regulation, *Optimization, Reservoir operation, Water policy.

Optimal regulation policies for a multipurpose reservoir are characterized analytically for the case where the input and return functions are subject to seasonal variations and the return function is piecewise linear, concave, and separable in reservoir volume and discharge. Efficient upper and lower bounds on optimal policies are derived from two important special cases. Necessary and sufficient conditions are obtained for a finite-time horizon optimal policy to be also optimal for the infinite-time horizon. (Snyder-Calif, Davis)

THE PRODUCTION OF PULP FROM MARSH GRASS.
Mississippi State Univ., Mississippi State. Dept. of Zoology.
A. A. de la Cruz.
Economic Botany, Vol. 32, No. 1, p 46-50, January-March, 1978. 3 fig, 5 ref.

Descriptors: *Pulp and paper industry, *Rooted aquatic plants, *Harvesting, Crops, Marshes, Wetlands, Aquatic plants, Paper industry, Grasses, Romania.

The Romanian Government had develolped and constructed machinery for the large-scale processing of red (Phragmites communis) pulp. The annual harvest of 125,000 tons of dry weight raw reed is based on an ecologically sound natural cycle of reed production. When processed, raw reed yields up to 60% in unbleached pulp which is mixed with wood pulp in the production of fabricated paper. At $85.00/ton of raw reed material, the reed pulp industry amounts to over $10 million annual revenue. (Sthiler Mass)

Operations Research, Vol. 26, No. 4, p 551-562, July-August 1978. 2 fig, 1 tab. OWRT A-043-CAL(4).

Descriptors: *Reservoirs, *Regulation, *Water policy, *Optimization, Benefit maximization, Heuristic approach, Hydrologic aspects, Dams, Reservoir releases, Operations research, Mathematical models.

Optimal regulation policies for two reservoirs, connected in series, with seasonal and possibly cross-correlated inflows, and analytically characterized when the immediate reward function is a piecewise linear concave function of the release and the objective is to mazimize the expected discounted rewards over finite and infinite time horizons. The optimal policies are expressed in terms of certain critical numbers for which upper

and lower bounds are obtained. Proposed is a heuristic approach for multi-reservoir systems under less restrictive assumptions; it is applied to two reservoirs connected in parallel. (Bell-Cornell)

THE UPPER COLUMBIA NAVIGATION PROPOSAL.
Cornell, Howland, Hayes and Merryfield, Bellevue, WA
Available from the National Technical Information Service, Springfield, VA 22161 as PB-255 615, Price codes: A07 in paper copy, A01 in microfiche. Prepared for the Inland Empire Waterways Associaton, Walla Walla, WA, May 1970, 118 p, 3 maps, 12 fig, 41 tab.

Descriptors: *Cost-benefit analysis, *Feasibility studies, *Water resources development, *National income, *Regional development, *Washington, Environmental effects, Social values, Social impact, Recreation, Transportation, Employment, Unemployment, Discount rates, Project feasibility, *Upper Columbia River(WA), Freight traffic, Project life.

The purposes of this study were to make an independent evaluation of the economic and social feasibility of the proposed Upper Columbia navigation extension (125 miles up the Columbia River) and to test the revised procedures of the Special Task Force of the National Water Resources Council. The analysis included: (1) current economic profile of the area immediately affected; (2) results of an evaluation of transportation savings and other income effects from a national viewpoint; (3) regional income effects; (4) expected environmental effects; (5) the project's effect on the wellbeing of people; (6) length of evaluation of project life and the relevance of salvage value and continual maintenance; and (7) the effect of increasing river flow on dredging costs. Objectives to be given equal weight when judging a project for federal funding include: national income; regional development; environmental enhancement; and wellbeing of people. Conclusions indicate that substantial savings from the proposed waterway navigation may exist; that recreational boating would be enhanced; that unemployment in the region would be normally relieved; that proper planning and management during channel dredging would minimize effects of the natural environment; and that the social well-being of the nation may be enhanced by higher rates of economic and population growth, relieving pressure on overcrowded areas. The results are expected to be useful in further consideration of the value of this project and in judging the operational significance of the suggested revised procedures for evaluation of water resource projects. (Coan-NC)

FLOOD PLAIN INFORMATION: PIGEON CREEK, BENTLEYVILLE, FALLOWFIELD TOWNSHIP AND SOMERSET TOWNSHIP, PENNSYLVANIA.
Army Engineer District, Pittsburgh, PA.
Prepared for the Bentleyville-Fallowfield Regional Planning Commission, PA, March 1968, 27 p, 2 fig, 9 plates, 8 tab.

Descriptors: *Pennsylvania, *Flood forcasting, *Stage-discharge relations, Floods, Indirect flood measurement, Historic floods, Flood data, Flood recurrence interval, Flood stages, Peak discharge, Flood peak, Flow duration, Standard project flood, Somerset(PA), Bentleyville(PA), Fallowfield(PA), *Pigeon Creek(PA), Intermediate regional flood.

The study area is the Pigeon Creek flood plain located in Fallowfield Township, Somerset Township, and Bentleyville in Washington County, Pennsylvania. The flood plain is generally narrow with the widest portion in the Bentleyville Area. Damageable development in the study area is contained primarily in Bentleyville and consists of residential and commercial establishments. Flood data were obtained from maps, interviews with local residents, newspaper files and historical records. There are no existing flood plain regulations in the study area and no existing, authorized or proposed flood control measures in the surrounding watershed. The main flood season for Pigeon Creek is in winter and early spring. Floods generally result from heavy rains and rapid snowmelt but occasionally are caused by intense thunderstorms. The greatest flood on Pigeon Creek occurred at Bentleyville on August 5, 1956, with a peak discharge of 4,100 cubic feet per second (cfs). The Intermediate Regional Flood is estimated to have a discharge of 5,000 cfs near the Van Voorhis Highway bridge. At the same location, the Standard Project Flood would have an average discharge of 9,000 cfs. This report provides a basis for further study and planning to minimize vulnerability to flood damages. (Coan-NC)
W79-01850

FLOOD HAZARD INFORMATION: CLOVER CREEK, STILLWATER CREEK AND STILLWATER CREEK TRIBUTARIES, LOOMIS CORNERS, CALIFORNIA.
Army Engineer District, Sacramento, CA.
Prepared for Shasta County, CA., October 1977, 12 p, 4 fig, 16 plates, 5 tab.

Descriptors: *California, *Flood forecasting, *Peak discharge, Floods, Flood flow, Indirect flood measurement, Flood profiles, Historic floods, Flood data, Flood stages, Flood peak, Flow characteristics, Flood damage, Erosion, Deposition(Sediments), Flood protection, Flood plain zoning, Zoning, Dams, *Clover Creek(CA), *Stillwater Creek(CA), Loomis Corners(CA), Sacramento River(CA), Shasta County(CA), 100-year flood, 500-year flood.

The study area includes the flood plains of Clover Creek from Hartnell Avenue to River Valley Drive, Stillwater Creek, and the lower reaches of Salmon and Clough Creeks in the vicinity of Loomis Corner's in Shasta County, CA. These creeks are tributaries of the Sacramento River. The streams together drain approximately 70 square miles. Development in the study area may be generally classified rural and rural-residential with very limited commercial activity. Flood data were gathered from topographical maps, newspaper files, and various governmental agencies. The only existing flood control project having an effect on the study area is Shasta Dam, located on the Sacramento River in the foothill region north of the study area. Information on past floods is very limited because neither streamflow records nor eyewitness accounts are available. Flooding generally results from prolonged winter rainstorms occurring anytime during the period November through March. Flood hazards along Clover Creek are minimal and could be handled by channel alterations. All 7 of the road bridges across Stillwater Creek are considered obstructive to flood flows. Peak flows for the 100-year flood and 500-year flood on Stilldwater Creek at Dersch Road would be 21,000 cubic feet per second (cfs) and 29,000 cfs, respectively. on Salmon Creek at Old Alturas Road peak flows would be 2,100 cfs and 2,900 cfs for the 100-year and 500-year floods, respectively. This report will aid in planning the best use of lands subject to inundation from 100- and 500-year floods. (Coan-NC)
W79-01851

FLOOD PLAIN INFORMATION: SALT CREEK AND TRIBUTARIES, OLNEY, TEXAS.
Army Engineer District Fort Worth, TX.
Prepared for City of Olney, TX. June 1976, 35 p, 6 fig, 11 plates, 8 tab.

Descriptors: *Texas, *Flood data, Floods, Floodwater, Flood flow, River flow, Indirect flood measurement, Flood forecasting, Historic floods, *Peak discharge, Flood stages, Flow duration, Stage-discharge relations, Flood damage, Flood protection, Non-structural alternatives, Flood plain zoning, Flood plain insurance, Warning systems, Building codes, Land use, Planning, Zoning, Control structures, Dams, Reservoirs, Floodproofing, *Salt Creek(TX), Olney(TX), Mud Creek(TX), 100-year flood, 500-year flood, Flood plain management.

The study area is the watershed of Salt Creek near Olney, Young County, Texas, located in the larger Brazos River Basin. The floodplains of Salt Creek are primarily rural except for residential, industrial, and commercial development located within the city of Olney itself. The sources of flood data include U.S. Geological Survey gaging stations, National Weather Service records, topographical maps, and historical documents and records. There are no existing structural flood damage reduction measures along Salt Creek or its tributaries. Most of the flood-producing thunderstorms and rainfall

r in the spring and early fall, but may occur at time. Natural obstruction to flood flows in- e trees, brush, and other vegetation growing g the stream banks in flooding areas. Peak d discharges were not availble for Salt Creek the worst flood in the area occurred on the os River near Seymour, Texas, in October, , with a peak discharge of 95,400 cubic feet econd (cfs). The 100-year and 500-year floods alt Creek are predicted to reach discharges of 0 cfs and 50,000 cfs, respectively below the w Pond Circle. Peak discharges for Mud k, a tributary of Salt Creek, would be 8,900 or the 100-year flood and 12,400 cfs for the ear flood. Guidelines for flood plain manage- are presented, including both regulatory and egulatory methods of flood control. This rt is intended to provide information on flood rds and guidelines for flood plain management. n-NC)
-01852

OD PLAIN INFORMATION: FRANK- WN BRANCH, JUNIATA RIVER, CLAYS- G, PENNSYLVANIA.
y Engineer District, Baltimore, MD.
ared for Blair County Planning Commission, Feb 1977, 26 p, 11 fig, 14 plates, 4 tab.

riptors: *Pennsylvania, *Flood data, *Stage- arge relations, Floods, Indirect flood mea- ent, Flood forecasting, Historic floods, d recurrence interval, Flood stages, Peak dis- e, Flood protection, Warning systems, burg(PA), Frankstown Branch(PA), *Juniata (PA), East Freedom(PA), 100-year flood, ear flood, Blair County(PA).

study area is the portions of the towns of burg and East Freedom, Pennsylvania sub- o flooding from the Frankstown Branch of uniata River. Properties along these streams rimarily residential, with some commercial gricultural development. No stream gages are d within the study area. Flood data were red from U.S. Geological Survey bench mark s and newspaer accounts of past floods. from the Frankstown Branch have occurred g all seasons of the year with acute flooding g the spring season, resulting from snowmelt, rains, and some hurricane activity. There present plans for flood control projects and ning ordinances, building codes or other reg- y measures for the reduction of flood dam- Many of the bridges in the study area are ctive to flood flows. The worst flood prob- occurred on March 18, 1936, but no actual ls of discharges or cost of damages were ble. Other large floods occurred in 1973, 1961 and 1972. At the mouth of the Frank- Branch, the 100-year flood would discharge cubic feet per second (cfs), while the 500- lood would discharge 28,400 cfs at the same n. This study was authorized to provide a or the development of flood plain manage- measures by the Blair County Planning Com- n. (Coan-NC)
01853

D PLAIN INFORMATION: MUDDY CH, MONTGOMERY COUNTY MARY- .
Engineer District, Baltimore, MD.
red for Maryland-National Capital Park and ng Commission, June 1972, 21 p, 2 fig, 11 5 tab.

ptors: *Maryland, *Flood stages, *Peak dis- e, Floods, Indirect flood measurement, Flood sting, Flood profiles, Historic floods, Flood ence interval, Flood peak, Flow duration, discharge relations, Flood damage, Bank n, Standard project flood, Flood protection, plain zoning, Warning systems, Zoning, ly Branch(MD), Montgomery County(MD), d(MD), Gaithersburg(MD), Intermediate al Flood.

tudy area is the flood plain of Muddy n, a tributary of the Potamac River near Gaithersburg, Maryland. The Muddy Branch watershed drains and area of 19 square miles and is located entirely within Montgomery County. Except for highways and bridges, development in the flood plain is limited to scattered residential developments and a commercial-industrial complex. Muddy branch is an ungaged stream so flood data were gathered from interviews with local residents and historical records. There are no existing authorized, or porposed flood control measures in the Muddy Branch area. A county subdivision ordinance restricts residential and commercial development in the 50-year flood plain. Flood data are provided for streams in the vicinity of Muddy Branch. The greatest recorded flood occurred on Seneca Creek, near Dawsonville, in July 1956 discharging 15,000 cubic feet per second(cfs). Flooding occurred in the Muddy Branch flood plain in 1956, 1967, 1969, 1970 and 1971. The Intermediate Regional Flood near the mouth of Muddy Branch would discharge 4,800 cfs, rising to 14.8 feet above streambed. The Standard Project Flood would discharge 10,600 cfs, rising to 22.3 feet above planning on the part of planning agencies trying to minimize flood damages.(Coan-NC)
W79-01854

FLOOD HAZARD INFORMATION: SACRAMENTO RIVER AND COTTONWOOD AND BATTLE CREEKS, COTTONWOOD-BEND AREA, CALIFORNIA.
Army Engineer District, Sacramento, CA.
Prepared for Shasta and Tehama Counties, CA., August 1978, 18 p, 13 fig, 23 plates, 5 tab.

Descriptors: *California, *Flood profiles, *Peak discharge, Floods, Indirect flood measurement, Flood forecasting, Storms, Cloudbursts, Historic floods, Flood data, Flood stages, Flow characteristics, Flood damage, Flood protection, Control structures, *Cottonwood Creek(CA), *Battle Creek(CA), Sacramento Valley(CA), Shasta County(CA), Tehama County(CA), 100-year flood, 500-year flood.

The study area includes the flood plains along the Sacramento River and Cottonwood and Battle Creeks in the Cottonwood-Bend area, Shasta and Tehama Counties, California. The region is in the upper end of the Sacramento Valley, the northern sector of the central valley of California. Development in the flood plain area is primarily limited to residential and agricultural sites. Flood data were gathered from library sources, U.S. Geological Survey topographic maps, newspaper reports, and from other governmental agencies. The main flood control structure is Shasta Dam which provides protection from rainfloods and snowmelt runoff originating in the Sacramento River Basin above Shasta Lake. Flooding generally results from intense widespread storms occurring from November through April, and occasionally, from snowmelt runoff during April through June. Five of the bridges in the study area are considered obstructive to flood flow. The worst flood on the Sacramento River after construction of Shasta Dam occurred in January 1970, discharging 157,000 cubic feet per second (cfs). On Cottonwood and Battle Creeks, the worst floods occurred in January of 1974 and 1970, respectively, discharging 70,000 cfs on Cottonwood Creek and 24,300 cfs on Battle Creek. Peak flows for the 100-year and 500-year floods on the Sacramento River near Bend bridge would be 288,000 cfs and 535,000 cfs, respectively. On Cottonwood Creek the 100-year flood would discharge 106,000 cfs and the 500-year flood, 156,000 cfs, while on Battle Creek the discharge would be 36,200 cfs and 52,400 cfs, respectively. This report will aid in planning the best use of lands subject to inundation from 100- and 500-year floods. (Coan-NC)
W79-01855

FLOOD PLAIN INFORMATION: BIRD CREEK AND TRIBUTARIES, PAWHUSKA, OKLAHOMA.
Army Engineer District, Tulsa, OK.
Prepared for City of Pawhuska, OK, June 1974, 30 p, 7 fig, 11 plates, 5 tab.

Descriptors: *Oklahoma, *Flood profiles, *Flood data, *Peak discharge, *Non-structural alternatives, Floods, Flooding, Flood flow, Historic floods, Flow duration, Flood plains, Standard Project Flood, Flood protection, Flood plain zoning, Flood plain insurance, Warning systems, Building codes, Land use, Planning, Control structures, Reservoirs, *Bird Creek(OK), Pawhuska(OK), Intermediate Regional Flood.

The study area includes Bird Creek, its tributaries, and their flood plains in the vicinity of Pawhuska, Oklahoma. Developments in the flood plain include commercial, residential, and industrial land uses. Flood data were obtained from topographic maps, field studies and historical sources. Since no stream gage records were available, flood profile projections were based on data from watersheds in the region with similar characteristics. Intense thunderstorms cause most flooding in the region, from May through October. The worst known flood occurred in 1915. Recent major floods occurred in 1959 and 1974. On Bird Creek, the Intermediate Regional Flood (IRF) would discharge 38,700 cubic feet per second (cfs) and would rise 3.1 feet, while the Standard Project Flood (SPF) would discharge 75,900 cfs and would rise 8.5 feet. A water supply reservoir in the area provides some flood control capacity which results in lowering the water surface elevations of the IRF on Bird Creek through Pawhuska by about 2 feet. No other structural flood control measures are anticipated. Non-structural measures have not been enacted. Guidelines for flood plain management are presented. This study is intended for use in making land use planning and management decisions concerning flood plain utilization. (Nessa-NC)
W79-01856

FLOOD PLAIN INFORMATION: PROVO RIVER AND SLATE CANYON CREEK, PROVO, UTAH.
Army Engineer District, Sacramento, CA.
Prepared for Board of County Commissioners, Utah County, UT, May 1972, 34 p, 12 fig, 12 plates, 6 tab.

Descriptors: *Utah, *Flood profiles, *Flood data, *Peak discharge, Floods, Flood flow, Flow characteristics, Flood plains, Standard Project Flood, Flood protection, Non-structural alternatives, Land use, Planning, Control structures, Reservoirs, *Provo River(UT), Provo(UT), *Slate Canyon Creek(UT), Utah County(UT), Intermediate Regional Flood.

The study area includes the Provo River flood plain and the Slate Canyon Creek outwash fan in Provo, Utah. Both flood plains contain some residential and commercial developments, but they are mostly devoted to non-intensive land uses. Flood data were obtained from topographic maps, field studies, historical sources, and stream gage records. Deer Creek Reservoir provides incidential flood control. A flood control reservoir has been authorized. Flooding along the Provo River results primarily from snowmelt originating above Deer Creek Reservoir when the reservoir is full. These floods occur from late April through early July. Flooding on the Slate Canyon Creek outwash fan results from high intensity convective-type thunderstorms centered over the tributary area. These floods occur from May through September. The worst flood recorded at the Provo gage occurred on May 6, 1952, discharging 2,520 cubic feet per second (cfs). At the downstream study limit, the Intermediate Regional Flood would discharge 3,000 cfs and would crest at 4494 feet mean sea level (msl), while the Standard Project Flood would discharge 5,200 cfs and would crest at 4494.5 feet msl. This study is intended for use in making land use planning and management decisions concerning flood plain utilization. (Nessa-NC)
W79-01857

FLOOD PLAIN INFORMATION: COAL CREEK AND TRIBUTARIES, HENRYETTA, OKLAHOMA.
Army Engineer District, Tulsa, OK.

Group 4A—Control Of Water On The Surface

Prepared for City of Henryetta, OK, August 1975, 24 p, 5 fig, 14 plates, 5 tab.

Descriptors: *Oklahoma, *Flood profiles, *Flood data, *Peak discharge, *Non-structural alternatives, Floods, Flood flow, Historic floods, Flow characteristics, Flood plains, Standard Project Flood, Flood protection, Flood plain zoning, Flood plain insurance, Building codes, Land use, Planning, *Coal Creek(OK), Henryetta(OK), Intermediate Regional Flood.

The study area includes Coal Creek, its tributaries, and their flood plains in the vicinity of Henryetta, Oklahoma. Land use in the flood plain is residential, commercial, and agricultural. Intense thunderstorms cause most floods in the area from April through September. Flood data were obtained from topographic maps, field studies, and historical sources. No stream gage records are available. The worst known flood occurred on April 14, 1945. In the lower study reach, the Intermediate Regional Flood would discharge 12,400 cubic feet per second (cfs) and would rise 12.5 feet, while the Standard Project Flood would discharge 21,200 cfs and would rise 15.5 feet. Historic and projected flood data are also presented for the rest of the study area. Structural flood control measures neither exist nor are they anticipated. Non-structural measures have not been enacted. This study is intended for use in making land use planning and management decisions concerning flood plain utilization. (Nessa-NC)
W79-01858

FLOOD PLAIN INFORMATION: PANTHER AND BEAR BRANCHES, MONTGOMERY COUNTY, TEXAS.
Army Engineer District, Galveston, TX.
Prepared for Montgomery County, Texas, March 1974, 32 p, 6 fig, 22 plates, 4 tab.

Descriptors: *Texas, *Flood data, *Peak discharge, *Stage-discharge relations, Floods, Indirect flood measurement, Flood forecasting, Flood profiles, Historic floods, Flood stages, Standard Project Flood, Flood protection, Flood plain zoning, Warning systems, Building codes, Land use, Planning, Zoning, Control structures, *Panther Branch(TX), *Bear Branch(TX), Montgomery County(TX), Flood plain management, Intermediate Regional Flood.

The study area includes the floodplain of Panther Branch extending 16 stream miles northwest from its confluence with Spring Creek, and that of Bear Branch extending 10 stream miles northwesterly from its confluence with Panther Branch. Both streams are located in southeast Montgomery County, Texas, near Houston. Development in the flood plain is primarily agricultural, but because of development pressure in metropolitan Houston, residential and suporting service facilities are being built. There are no stream gage or discharge records available for Panther or Bear Branches. Flood data were collected from newspaper files, topographical maps, and the NOAA Weather Service. Obstructions in the stream flow are both manmade and natural, consisting of road crossings, landfills and bridges, trees, brush, and other vegetation. There are no flood control structures in the study area. Flooding is caused by intense local thundershowers, general storms and hurricanes, all occurring at any time of the year. Recent major floods occurred in 1960, 1961, 1964, 1966, 1968, 1972 and 1973. On Panther Branch, the Intermediate Regional Flood (IRF) would discharge 14,000 cubic feet per second (cfs), rising to 12 ft above the streambed, while the Standard Project Flood (SPF) would discharge 23,000 cfs and rise to 14.9 ft. above streambed. On Bear Branch, the IRF would discharge 8,900 cfs, rising to 12 ft above streambed; the SPF would discharge 14,700 cfs, rising to 14.9 ft. above streambed. Specific guidelines for flood plain management are presented, particularly non-structural alternatives. This report is intended to provide definitive data to aid in planning the best use of flood prone lands, or otherwise contribute to the solution of local flood problems. (Coan-NC)

FLOOD FREQUENCY DESIGN IN SPARSE-DATA REGIONS,
Alaska Univ., Fairbanks. Inst. of Water Resources.
R. F. Carlson, and P. M. Fox.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-289 389, Price codes: A02 in paper copy, A01 in microfiche. Report IWR-94. 1978. 11 p, 6 ref. OWRT B-030-ALAS(2), 14-31-0001-5217.

Descriptors: *Alluvial channels, *Design flood, *Flood frequency, Hydrologic data, Scour, Flood protection, *Design criteria, *Alaska, Risks, Data collections, Pipelines, *Northern region(Alas), *Bayesian analysis, *Sparse data.

The project was directed towards improved techniques for flood capacity design in areas of extremely sparse data such as cold regions. The work included development of the appropriate risk selection with Bayesian analysis techniques. As most flood determination procedure involves some type of model calculation a portion of the work was aimed towards an appropriate model choosing technique. Several techniques were developed to describe the channel dynamics of northern braided rivers with particular emphasis on scour phenomenon and engineering structures. A field review of existing hydraulic engineering design performance examined bridge, culvert, and pipeline crossings along the Alyeska oil pipeline route from Fairbanks to Prudhoe Bay. A Bayesian based risk analysis procedure incorporated the model selection, the design hydrology, the channel geometry and the design demands in such a way so as to provide maximum reliability with very little available data. The report includes abstracts of eight publications which have been prepared as a result of the project.

REMOTE SENSING ASSESSMENT OF DAM FLOODING HAZARDS: METHODOLOGY DEVELOPMENT FOR THE NEW YORK STATE DAM SAFETY PROGRAM,
Cornell Univ., Ithaca, NY. Center for Environmental Research.
J. P. Berger, W. R. Philipson, and T. Liang.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-289 371, Price codes: A04 in paper copy, A01 in microfiche. Research Project Technical Completion Report, November, 1978. 61 p, 23 fig, 8 tab. OWRT A-081-NY(1). 14-34-0001-8034.

Descriptors: *Remote sensing, *Dams, *Aerial photography, Satellites(Artificial), *Flood control, *Hazards, Dam failure, *Dam safety programs, *New York, Methodology, Data collections, Mapping, Evaluation, Surveys.

The value and use of remotely sensed aircraft and satellite data for inventorying dams, determining their hazard class, and assessing their condition is described. A methodology is developed to increase the efficiency and accuracy of dam inspection in New York State by incorporating remote sensing techniques into the State Dam Safety Program. The methodology places emphasis on readily available remotely sensed data--aerial photographs and Landsat data. Aerial photographs are employed in establishing a statewide data base, referenced on county highway and U.S. Geological Survey 1:24,000 scale, topographic maps. Data base updates are conducted by region or county, using Landsat or aerial photographs as a primary source of information. Field investigations are generally limited to high-hazard or special problem dams, or to dams which cannot be assessed adequately with aerial photographs. Although emphasis is placed on available data, parameters for acquiring new aircraft data are outlined and various sensors considered. Large scale (1:10,000) vertical, stereoscopic, color-infrared aircraft photography, flown during the spring or fall, is recommended for assessing dam condition.

EXPERIENCE IN ARTIFICIAL GROUNDWATER RECHARGE FOR WATER SUPPLY IN LITHUANIA,
I. P. Dilyunas.
Soviet Hydrology: Selected Papers, Vol. 15, No. 4, p 340-343, 1976. 3 fig, 5 ref. Translated from Hydraulic Engineering and Reclamation (Gidrotekhnika i melioratsiya), No. 7, p 78-84, 1976.

Descriptors: *Groundwater recharge, *Water supply, *Aquifers, *Artificial recharge, Recharge Pit recharge, Induced infiltration, Recharge wells, Injection wells, Water reuse, Infiltration rates, Foreign research, Foreign countries, Water quality, Percolation, On-site tests, On-site investigation.

Lithuania has large groundwater resources because of its location in the temperate climatic belt with ample precipitation (500-850 mm/year), its dense drainage network (averaging 0.4 km/sq km), and the widespread occurrence of sandy-gravel mantle deposits in the Quaternary glacial stratum which is 100-150 m or more thick. Systematic investigations of groundwater recharge methods for water supply have been conducted since 1960. An alluviall aquifer 9-20 m thick in sandy-gravel deposits is exploited in the area of the Eygulya water intake. The groundwaters are recharged artificially from two infiltration basins with infiltration areas of 4,250 and 3,790 sq m at a filling depth of 3.2-3.4 m. Their beds consist of coarse-grained sand underlain by gravelly-pebbly deposits. Infiltration occurs without backwater: the depth from the bottom of the basins to the groundwater remains at 6-6.5 m throughout the infiltration cycle. The percolation rate during the infiltration cycle varies from 2.8 to 0.05 m/day and averages 0.5 m/day. Artificial groundwater recharge is justified in all the cases examined. This is a fairly efficient water supply method under the conditions prevailing in Lithuania, and it should be used to replenish the exploitable groundwater reserves. (Humphreys-ISWS)

ARTIFICIAL GROUND-WATER RECHARGE AS A WATER-MANAGEMENT TECHNIQUE ON THE SOUTHERN HIGH PLAINS OF TEXAS AND NEW MEXICO,
Texas Dept. of Water Resources, Austin.
R. F. Brown, D. C. Signor, and W. W. Wood.
Report No. 220, August 1978. 32 p, 23 fig, 1 tab, 23 ref.

Descriptors: *Water management(Applied), *Groundwater, *Aquifers, *Water-spreading basins, *Injection wells, *Artificial recharge, *Southwest U.S., *Ogallala Formation, Texas, New Mexico, Southern High Plains(TX, NM), Plains, Irrigation, Lakes, Playas, Permeability, Flocculation, Pumping, Costs, Arid lands, Clays, Dry farming, Reclamation states.

Two methods of artificial groundwater recharge in the Ogallala Formation aquifer in the southern high plains of Texas and New Mexico are described: (1) water-spreading basins, and (2) injection wells. Both systems use water collected in the thousands of playa lakes in the region; this water normally evaporates rapidly (about 12.7 mm/day in summer). Little water moves downward from the playas due to clay-sealed central basins. The Ogallala aquifer receives less than two mm water/year under present climatic conditions, but an average of 305 mm are withdrawn annually. Most irrigated farms in the central and southern parts of the southern high plains will becme dryland farms before the year 2000 at the current rate of water use. Field tests and laboratory research indicate that spreading basins are the most economical approach to recharge in most areas, but where surficial materials have low vertical permeability, injection wells offer a viable alternative. Both systems: (1) pump water from the playa lakes, preferably from near the surface to reduce sediment load; (2) treat the water with a flocculant to speed settling of sediment; and (3) hold the water in a settling basin for sedimentation. With spreading basins, the clarified water is pumped into the basins, located in an area with highly permeable sediments (greater than 0.3 m/day surface, 0.06 m/day below). In areas with impermeable sediments, water is pumped into the aquifer by way of injection wells. (Lynch-Wisconsin)

INLAND LAND USE ACTIVITIES AND GEORGIA'S COASTAL WATERS.
Georgia Dept. of Natural Resources, Atlanta. Office of Planning and Research.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 944, Price codes: A11 in paper copy, A01 in microfiche. October 1976. 17 fig, 1 tab, 106 ref.

Descriptors: *Georgia, *Coasts, *Land management, Wetlands, Inland waterways, Coastal marshes, Land use, Estuaries, Coastal waterways.

Information has been assembled related to the impact of inland land use activities on Georgia's coastal waters, including marshes and estuaries. Natural resource processes which affect the impact of inland activities, such as flows of water, sediments, and nutrients, are described. In addition, available information describing impacts from forestry, agriculture, urbanization, and large-scale public works projects are included. Although the report does not contain policy recommendations, this background information is useful for developing coastal zone management program goals and objectives. (Steiner-Mass)

SEEDLING EMERGENCE AS RELATED TO TEMPERATURE AND MOISTURE TENSION,
Florida Univ., Quincy. Dept. of Agronomy.
D. L. Wright, R. E. Blaser, and J. M. Woodruff.
Agronomy Journal, Vol. 70, No. 5, p 709-712, September-October, 1978. 1 fig, 1 tab, 16 ref.

Descriptors: Erosion control, *Grasses, Legumes, Highway beautification, *Germination, *Seeds, *Moisture tension, *Temperature.

To aid in selection of species for mixtures of seed for controlling erosion on newly constructed highway slopes, an experiment was designed to determine total emergence and rates of emergence of several grass and legume species and cultivars under various soil moisture and temperature regimes. The experimental observation suggested that the aggressive species of annual and perennial ryegrass, German millet, redtop, weeping lovegrass, and Abruzzi rye compete strongly with slower developing perennial grasses and legumes when seeded in the appropriate season. It was also observed that successful establishment of the intermediate species such as bluegrass, crownvetch, creeping red fescue, and Kentucky 31 tall fescue depends on cool temperatures and high moisture availability. Nonaggressive species of crownvetch and sericea also required high moisture and cool temperature, whereas common bermudagrass needed high moisture and warm temperatures. It was concluded that modification of seed mixtures should depend on the season of seeding and the type of vegetation desired, and that lower rates of aggressive species should be used while seeding mixtures of agressive species should be used while seeding mixtures of aggressive species with slow-developing species when conditions favor rapid emergence and growth for both. 5. WATER QUALITY MANAGEMENT AND PROTECTION

5A. Identification Of Pollutants

PROBLEMS IN AUTOMATING THE MONITORING OF SURFACE WATER CHEMISTRY,
Hydrochemical Inst., Novocherkassk (USSR).
V. B. Stradomskiy.
Soviet Hydrology: Selected Papers, Vol 15, No 4, p 288-299, 1976. 6 fig, 6 tab, 29 ref. Translated from Gidrokhimicheskiye Materialy, Vol 63, p 3-21, 1976.

Descriptors: *Water chemistry, *Surface waters, *Automation, *Instrumentation, Water pollution, Pollutants, Water temperature, Dissolved oxygen, Hydrogen ion concentration, Suspended solids, Chemicals, Water quality, Rivers, Monitoring, Surveys, *USSR.

Modern equipment for determining the physical properties and chemical characteristics of water permits partial automation. In the future, most of the important characteristics that control surface water quality will be determined automatically using improved automation equipment and high-efficiency instruments, making it possible to measure the necessary water consumption characteristics directly in situ at the necessary point of a body of water. Automation of water quality monitoring involves the solution of at least three independent, but very closely related, problems: (1) the design principles of water quality monitoring and control systems; (2) instrumental methods and instruments for automated monitoring; and (3) mathematical base of the system (including cybernetic and physical simulation). An automated system would provide continuous monitoring of the chemical composition of surface water that varies rapidly in time and space on a new qualitative level, allowing water conservation planning. PART I: APPLICATION OF PULSE POLAROGRAPHY AND PULSE ANODIC STRIPPING TO THE DETERMINATION OF SELECTED HEAVY METALS IN NATURAL WATERS--PART II: APPLICATION OF CONTROLLED POTENTIAL COULOMETRIC TECHNIQUES TO THE DETERMINATION OF URANIUM,
Tennessee Univ., Knoxville.
S. T. Crosmun.
Available from the National Technical Information Service, Springfield, VA 22161 as TID-27709, Price codes: A06 in paper copy, A01 in microfiche. Ph D Dissertation, June 1977. 115 p 12 fig, 9 tab, 88 ref, 4 append.

Descriptors: *Polarographic analysis, *Heavy metals, *Water analysis, *Analytical techniques, *Trace elements, Instrumentation, Chemical analysis, Testing procedures, Cadmium, Toxicity, Lead, Pollutants, Zinc, Chromium, Water pollution, Analysis, *Pulse polarography, *Pulse anodic stripping, *Coulometric techniques, Uranium, Micro-analysis, Electrochemistry.

The use of a thin mercury film wax-impregnat graphite electrode for the simultaneous determin tion of cadium, lead, and zinc in an acetate buff by differential pulse anodic stripping voltammet was described. Optimal instrumental paramete for maximum resolution and sensitivity for simult neous analysis of these three elements in natu waters were discussed. The interference of copp with the determination of zinc was investigated detail. An optimal mercury film thickness for t electrode was suggested. A method utilizing diff ential pulse polarography for the determination chromium (VI) in natural water was describe Additions of 0.62 micrograms Cu(II)/ml and 0. micrograms Fe(III)/ml did not interfere with t determination of 0.050 micrograms Cr(VI)/m The natural water samples containing Cr(VI) we buffered to approximately pH 7 with 0.1 M amm nium acetate and 0.005 M ethlenediamine and an lyzed. Natural water samples of chromium fro 0.035 microgrms to 2.0 micrograms/ml may analyzed directly without further preparation. T detection limit is 0.010 micrograms/ml. A nov highly efficient cell with integral stirrer for co trolled potential coulometry was described. T cell was used to demonstrate the feasibility determining uranium (VI by predictive cou metry. A PDP 8/I minicomputer was used predict the coulometric endpoint with high accu cy within 2.5 minutes in a titration which norma takes about 10 minutes. This technique was sho to yield acceptable results even in the presence an interfering phosphate matrix. (Henley-ISW

BIOLOGICAL ASSESSMENT OF WAT QUALITY IN A LARGE RIVER SYSTEM: EVALUATION OF A METHOD FOR FISH
Virginia Polytechnic Inst. and State Univ., Blac burg. Dept. of Biology.
C. H. Hocutt, R. L. Kaesler, M. T. Masnik, and Cairn, Jr.
In: European Inland Fisheries Advisory Comm sion, Symposium on Methodology for the Surv Monitoring and Appraisal of Fishery Resource Lakes and Large Rivers. Symposium 55, Ma 1974. 20 p, 5 tab, 8 fig.

Descriptors: *Bioindicators, *Statistical meth *Analytical techniques, *Stress, *Water qua control, *Biological communities, Mathem studies, Water quality, Fish, Fresh water, *Jacc similarity coefficient, *Diversity index, Biolog assessment, Synthetic fibers, Virginia.

Fish have certain disadvantages and indicator stress conditions in aquatic systems. They mobile and can migrate to and from stressed a at will if not so drastically affected that moven is curtailed. Furthermore, data gathering may highly qualitative and not easily interpreted. public, however, more often focuses its atten on fish than other aquatic organisms and is fully satisfied about the health of an aquatic sys unless fish information is available. This study vides data on fish collected during the summ 1971 and 1972 from the New River is the vici of a synthetic fibers plat, Pearisburg, Virg These data were analyzed by two methods

onstrasted: the diversity index of Wilhm and Dorris and the Jaccard similarity coefficient. The ormer is a method currently used in monitoring quatic ecosystems and is a function of the numers and kinds of species found. The latter analyzes nly presence or absence of data at each station, nd provides a more critical method of analyzing ata. The Jaccard similarity coefficient is recomended as a method for the biological assessment f water quality. (EIS-Katz)

OSSIBLE CHANGES IN AEROSOL COMPOITION DUE TO DEPARTURE FROM EQUIIBRIUM CONDITIONS DURING SAMPLING,
wedish Water and Air Pollution Research Lab., oteborg.
. Brosset.
ublication No. B 454, July 1978. 28 p, 4 fig, 7 tab, ref.

escriptors: *Sampling, *Aerosols, *Equilibrium, Particle size, *Particulates, *Path of pollutants, Gases, *Air pollution, Fallout, Solubility, Methdology, Analytical techniques, Liquids, Pressure, quations, Acids, Volatility, Chemistry, Ammonia, itric acid, Hydrogen chloride, Water, Ammonin, Ions.

mple equations are presented which express the lationship at equilibrium between the partial essures of gaseous components (water, nitric id, hydrogen chloride, and ammonia) and the spective ion concentrations in the liquid phase ulfate, nitrate, chlorine, ammonium, and hydron). These equations can be used to show changes at may occur in the aerosol composition when ch a system is exposed to certain disturbances in nnection with particle sampling. All calculations owed that departure from équilibrium causes the lease of volatile components and transformation om the liquid phase to the gas phase. In some ses sampling total suspended matter and analyzg the gas passing through a filter is advantaous. Chemical properties of particles differ in lationship to the two main classes of size fracns, fine and coarse. Two such particle populaons were assumed to be in equilibrium with the s phase, then effects of changes in sampling were vestigated. Changes assessed were: (1) reduction ammonia concentration, and (2) reduction in ncentrations of acid gases (nitric acid and hydron chloride). Effects of changes in the water ntent of the system were analyzed, such as heatg the filter to keep particle samples dry, which sulted in a considerable percentage loss of nitric id and hydrogen chloride in fine particles and drogen ion and ammonium in coarse particles. ynch-Wisconsin)

escriptors: *Viruses, *Water pollution, *Public alth, *Water supply, Disinfection, Environmensanitation, Water pollution control, Evaluation, ater pollution sources, Investigations, Occoquan, boratory tests, Water sampling, Quality control.

investigation was carried out following reports detection of live poliovirus 1 in four samples of ished water collected from the Occoquan, Virnia, reservoir system. An evaluation of the coltion sites and other bacteriological data relating the reportedly contaminated samples indicated t the reservoir is an unlikely source of virus lution. Some of the reasons for this conclusion that chlorine concentration and pH levels at time were what is generally considered excelt for virus disinfection. Also, counts of cliform bacteria and other viruses were extremely low, indicating that the water was not heavily polluted with domestic waste. In addition, further studies on Occoquan water failed to detect a single virus. It is concluded that under the circumstances the detected viruses may be the result of exogenous contamination, such as laboratory handling. Some other occurrences of this type are described and the necessity for maintaining stringent laboratory procedures for preventing contamination is stressed. One source described is insufficient cleaning of laboratory apparatus after testing recovery systems using a seed virus. It is recommended that some kind of marker be included in the seed which is not present in naturally occuring virus. (Majtenyi-IPA)

DEVELOPMENT OF TECHNIQUE FOR DETECTION OF LOW MOLECULAR WEIGHT CONTAMINANT IN PRODUCT WATER FROM WATER PURIFICATION OR WATER REUSE SYSTEMS,
Amicon Corp., Lexington, MA.
T. W. Mix, and H. Scharen.
Available from the National Technical Information Service, Springfield, VA as ADA-038 148, Price codes: A05 in paper copy, A01 in microfiche. Final Comprehensive Report, August 1976. 88 p, 28 fig, 10 tab, 14 ref. DADA17-72-C-2169.

Descriptors: *Waste water treatment, *Monitoring, Colorimetry, *Water reuse, *Water purification, Reverse osmosis, Ozone, Permanganate, Spectrophotometry, Organic chemicals, Aldehydes, Water quality control, Technology.

A permanganate colorimeter was developed for detection of low molecular weight contaminants in waste water produced from water purification or water reuse systems. Main emphasis centered on monitoring quality of MUST product water which was processed through both reverse osmosis and ozonation. A permanganate colorimeter was selected for the following reasons: (1) the rate limiting step in ozonation of MUST reverse osmosis permeate appears to be ozonation of aldehydes, especially actaldehyde, which accumulate and represent and appreciable fraction of total organic carbon in the product water; (2) aldehydes are rapidly oxidized by basic permanganate solutions; (3) permanganate and manganate ions have high extinction coefficients and are rapidly detectable spectrophotometrically in low concentration; and (4) colorimetry is compatible with requirements for low cost, simplicty, reliability, durability, and portability. Also described are: a preliminary investigation of a spectrophotometer technique for the monitoring rate of decay of ozone as a measure of water purity; carbon adsorption experiments related to monitoring carbon column adsorption; and a preliminary study of monitoring combined reverse osmosis and ozonation as tertiary treatment for municipal treatment plant output. (Majtensyi-IPA)

PRELIMINARY EVALUATION OF THE WATER QUALITY OF PROPOSED TOWANDA LAKE, KANSAS.
Army Engineer Waterways Experiment Station, Vicksburg, MS.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A057 074, Price codes: A03 in paper copy, A01 in microfiche. Miscellaneous Paper Y-78-3, June 1978. 42 p, 10 tab, 1 append, 6 ref. Prepared in Environmental Laboratory, USAEWES.

Descriptors: *Water quality, *Evaluation, *Water analysis, *Kansas, Reservoirs, *Whitewater River(Kan), *Towanda Lake(Kan).

Investigated possible water-quality problems that may affect the realization of project benefits of proposed Towanda Lake--particularly the effects of total dissolved solids (TDS), chloride, and sulfate concentrations on water supply suitability. Because of high concentrations of these parameters, possible treatment processes were evaluated to alleviate potential water supply problems. The proposed impoundment would probably be well mixed, exhibiting weak, ephemeral stratification only during periods of calm weather. Therefore, a mass-balance routing of TDS, sulfates, and chlorides through the pool was performed. Results of the mass-balance routing indicated only minor problems should be expected with TDS levels and chloride and sulfate levels should remain below U.S. Environmental Protection Agency (EPA) criteria for these parameters. On the basis of this analysis, no special considerations in water treatment design are considered necessary for these parameters. Occasional algal blooms should be expected during periods of calm weather and this should be considered in the design of the water supply withdrawal system. Levels of fecal coliform bacteria in the headwaters of the reservoir should be expected to exceed EPA criteria following storm events, which may preclude the use of portions of the reservoir for primary contact recreation. IMPROVED TECHNIQUES FOR MARKING AND SAMPLING BAND-APPLIED FERTILIZERS AND PESTICIDES,
Wisconsin Univ.-Madison. Dept. of Soil Science.
L. L. Hendrickson, D. R. Keeney, D. B. Lesczynski, and L. M. Walsh.
Soil Science Society of America Journal, Vol. 42, No. 3, p 507-508, May-June, 1978. 1 fig, 1 tab, 10 ref.

Descriptors: Nitrification, Inhibitors, *Sampling, *Marking, Nitrogen compounds, *Fertilizers, *Pesticides.

Techniques for marking and sampling banded fertilizers were developed to estimate the rate of nitrification and the recovery of N from the band treated with a nitrification inhibitor. The band was marked by applying prilled elemental S at the point of fertilizer release. With this approach the band was easily detected many months after fertilizer application. The sampler was constructed of stainless steel and was 15 by 15 by 40 cm long. It was inserted into the soil above the previously located band and then removed and disassembled, and the soil subsectioned for a vertical profile of constituents in the band. The expanded dimensions of the sampler reduced sample variability, yet still allowed sufficient sampling efficiency to obtain adequate replication. These techniques provided more accurate estimates of nitrification and recovery of applied N and should find application in monitoring other fertilizers or pesticides on easily penetrated soils devoid of rocks. (Skogerboe-Colorado State)

DETERMINATION OF STABILITY CONSTANTS OF METAL-HUMIC ACID COMPLEXES BY POTENTIOMETRIC TITRATION AND ION-SELECTIVE ELECTRODES,
National Inst. for Environmental Studies, Yatabe (Japan). Water and Soil Environment Div.
T. Takamatsu, and T. Yoshida.
Soil Science, Vol. 125, No. 6, p 377-386, June, 1978. 8 fig, 4 tab, 19 ref, 14 equ.

Descriptors: *Heavy metals, *Humic acids, Electrodes, Pollutants, Copper, Cadmium, Lead, *Volumetric analysis.

A new technique based on the combined use of potentiometric titration and ion-selective electrodes was proposed for determining apparent stability constants (successive stability constants and overall stability constants) of divalent metal cation ($Cu(++)$, $Pb(++)$, and $Cd(++)$ complexes with humic acids. Fourteen humic acids from diverse sources, including humidified rice straw, were examined. The stability constants increased with an increase in pH, and the order of values obtained was $Cu(++) > Pb(++) >> Cd(++)$. The overall logarithmic stability constants with the soil humic acid examined were 8.65 for $Cu(++)$, 8.35 for $Pb(++)$, and 6.25 for $Cd(++)$ at pH 5.0. The overall stability constants of $Cd(++)$ complexes ranged from 430000 to 4.6 times 10 to the 7th power at pH 6.0. The overall stability constants increased with increasing humification in the higher humification range, and the values correspond to the contents of very weakly acidic functional groups. The binding mechanisms of the metal cation complexes with humic acids seemed to accompany the coordinate bonds of undissociated very weakly acidic functional groups, in addition to the ionic bonds through COOH and/or OH groups. PATTERN RECOGNITION TECHNIQUES APPLIED TO OIL IDENTIFICATION,
Connecticut Univ., Storrs. Dept. of Electrical Engineering and Computer Science.
Y. T. Chien, and T. J. Killeen.
In: Workshop on Pattern Recognition Applied to Oil Identification, November 11-12, 1976, Coronado, California, Institute of Electrical and Electronics Engineers Computer Society, IEEE Cat. No. 76CH1247-6C, p. 15-33. 12 fig, 14 ref. OWRT A-060-CONN(4), 14-31-0001-6007.

Descriptors: *Oil spills, *Computer programs, *Pollutant identification, Wate quality control, Waste identification, Oil pollution, Oil wastes, *Interactive computer systems, *Patterns recognition, *Pictorial information processor, Discrete waveforms, Thin-layer chromatography.

A brief review of pattern recognition technology as applied to oil spill identification is presented in this paper. Two computer-based systems that are potentially useful for oil spill identification are described. The first is an interactive graphics system which is most suitable for manipulating discrete wave-forms (such as FL or IR Spectra), with the aid of graphical display. The other system is a general 2-dimensional pictorial information processor, which is potentially useful for identifying oil images such as those produced by the TLC technique.

A PROBABILITY MODEL FOR MATCHING SUSPECTS WITH SPILLS - OR DID THE REAL SPILLER GET AWAY.,
Connecticut Univ., Storrs. Dept. of Statistics.
T. J. Killeen, and Y. T. Chien.
In: Workshop on Pattern Recognition Applied to Oil Identification, November 11-12, 1976, Coronado, California, Institute of Electrical and Electronics Engineers Computer Society, IEEE Cat. No. 76CH1247-6C, p. 66-72. 1 fig, 2 tab, 2 ref. OWRT A-060-CONN(3), 14-31-0001-6007.

Descriptors: *Oil spills, *Pollutant identification, *Water pollution sources, *Mathematical models, Model studies, Waste identification, Oil pollution, Oil wastes, *Probability model, *Chemical spectra, Weathering effects.

Severa techniques are used to 'fingerprint' oil by means of chemical spectra. Spectral changes which occur due to weathering are difficult to predict and may invalidate the results. Accurate simulation of weathering conditions is not possible, and weathering changes may be drastically different even for similar oils. Identification of the true spiller through visual examination of spectra is therefore not guaranteed even when all suspects and spill areas have been adequately sampled. A method of revising the probability of the guilt of suspects in an oil spill case has been developed. This technique utilizes the information contained in spectra obtained from suspects and spill samples. It also considers the possibility that the true spiller escaped without being sampled.

SCIENTIFIC AND TECHNICAL ASSESSMENT REPORT ON CADMIUM,
National Environmental Research Center, Research Triangle Park, NC.
Available from the National Technical Information Service, Springfield, VA, 22161 as PB-246 820, Price codes: A04 in paper copy, A01 in microfiche. Environmental Protection Agency, Star Series, EPA-600/6-75-003, 72 p, March 1975. 5 fig, 27 tab, 78 ref.

Descriptors: *Cadmium, *Toxicity, Public health, Human pathology, Path of pollutants, Metals, Chemical analysis, Water analysis, Water quality, Chemical properties, Environmental effects, Air pollution, Animal pathology, *Bioaccumulation, *Tissue analysis, *Carcinogens.

This report is a review and evaluation of the current knowledge of cadmium in the ienvironment as related to possible deleterious effects on human health and welfare. Sources, distribution, measurement, and control technology are also considered. Cadmium is widely distributed in the environment. The human body burden of cadmium is cumulative. The half-time of cadmium in man is estimated at over 10 years. Man's primary exposure is from food, tobacco smoke, water, and ambient air. Food and tobacco smoke are the major sources except in the immediate vicinity of major sources of atmospheric emissions of cadmium. Emphysema and other lung diseases have been related to industrial exposure to airborne cadmium compounds. Kidney damage has also resulted from long-term exposure to cadmium. Animal experiments link anemia, hypertension, testicular necrosis, and carcinogesis with cadmium exposure. Current knowledge of the dose-response relationship does not provide criteria on which to base standards. (EIS-Deal)

DETERMINATION OF POLYCHLORINATED BIPHENYLS IN PAPER MILL EFFLUENTS - THE INFLUENCE OF SUSPENDED SOLIDS,
Institute of Paper Chemistry, Appleton, WI.
D. B. Easty, and B. A. Wabers.
Tappi, Vol. 61, No. 10, p 71-74, October, 1978. 8 tab, 6 ref.

Descriptors: *Pulp wastes, *Aroclors, *Polychlorinated biphenyls, *Industrial wastes, *Analytical techniques, Solvent extractions, Surfactants, Fibers(Plant), Gas chromatography, Pollutant identification, Effluents, Water analysis, Chemical wastes, Waste water disposal.

Aroclor 1242, a toxic mixture of polychlorinated biphenyls (PCB) previously used in carbonless copy paper, is still apparent in pulp mill products effluents, and sludges because of the use of recycled fiber. Studies were performed to evaluate the EPA'S methodology for analyzing PCB's in paper mill effluents and process streams containing suspended solids. Chemical analyses involved liquid-liquid extraction, Florisil cleanup, and electron gas capture chromatograpy. The evaluatio focused on the retention of PCB's by hardwood and softwood fiber suspensions during separatory funnel extraction. The studies demonstrated that a two-step procedure was required for complete removal of Aroclor 1242 from suspensions of Cellulose fibers. The recommended procedure incorporated triple separatory funnel extraction followed by alcoholic KOH reflux of the isolated fibers. The EPA procedure was concluded to be adequate for mill effluents containing low amounts of suspended solids. The alcoholic KOH reflux stage was considered necessary to counteract that PCB sorption which was controlled by the fiber-specific surface area and resin content of the fiber suspensions. The presence of starches and pigments, with the possible exception of clay and talc, did not interfere with the two-step extraction procedure. (Schul, FIRL)

SHORT-TERM VARIATION OF THE CHEMICAL COMPOSITION OF THE NIAGARA RIVER,
Department of the Environmental, Burlington (Ontario). Water Quality Div.
C. H. Chan, and A. H. Clignett.
Fisheries and Environment Canada, Scientific Series No. 90, 1978, 35 p, 13 tab, 9 fig, 2 appen

Descriptors: *Water quality control, *Water quality, *Statistical methods, Water pollution, Pollutant identification, Water pollution sources, Phosphorus, Nitrogen, Nutrients, Ions, Chemical reactions, Ammonia, Chloride, Time series analysis, *Lake Ontario, *Niagara River, Pollution level

This report lists results of a daily sampling program at Niagra-on-the-Lake to obtain refined loading estimates of phosphorus, nitrogen and major ions into Lake Ontario from the Niagara River. The accuracy of the daily data within a week measured against data collected at hourly intervals. Samples were collected from an automatic water sampler. Four 7-day periods for each season were chosen to evaluate the variabilities in water quality. Summary statistical tables of hourly samples for nutrients and major ions for the 4 time periods are presented. Results show a significant and large seasonal variation in the chemical composition of the water. Charts showing a power spectral analysis on cyclic behavior in nutrient variables are presented. No significant diurnal variations were detected. Tables are included of daily mean concentrations of nutrients and major ions and the expected deviations from these mean concentrations. With the exception of ammonia, the concentration frequency distribution of each parameter measured within a week assumes a normal distribution. Thus, fewer water samples would give comparable results without losing too much accuracy saving time and money. (Coan-NC)

APPARATUS FOR THE CONTINUOUS MEASUREMENT OF THE CONCENTRATION OF OIL,
Horiba, Ltd., Kyoto (Japan). (Assignee).
M. Iwamoto, and T. Nomura.
U.S. Patent No. 4,103,162, 7 p, 3 fig, 4 ref; Official Gazette of the United States Patent Office, V 972, No 4, p 1722, July 25, 1978.

Descriptors: *Patents, *Oil pollution, *Oily water, Water pollution sources, Analytical techniques, Pollutant identification, Infra-red absorption techniques.

An apparatus for continuously measuring the concentration of oil in a water sample by the infra-red absorption method is described. The measuring response of the apparatus is rapid as opposed to previous devices and the accuracy in measuring the oil content is sufficiently accurate. The apparatus comprises a supply device which supplies an oil-containing water sample and another supplying device which supplies a solvent for extracting the oil in the sample in a controlled and continuous amount. An extractor connected to the supplying device has an agitator and receives the oil-containing water sample and solvent and serves to extract the oil component in the water sample with the solvent. ARSENIC LEVELS IN THE SURFACE AND GROUND WATERS ALONG WHITEWOOD CREEK, BELLE FOURCHE RIVER, AND A PORTION OF THE CHEYENNE RIVER, SOUTH DAKOTA,
Geological Survey, Vermillion, SD.
J. L. Stach, R. N. Helgerson, R. F. Bretz, M. J. Tipton, and D. R. Beissel.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-289 374, Price codes: A03 in paper copy, A01 in microfiche. Water Resources Institute, South Dakota State University, Brookings, Completion Report. July 1978. 42 p, 12 fig, 11 tab, 15 ref. OWRT A-054-SDAK(1), 14-34-0001-6043.

Descriptors: Observation wells, Recharge, Mine tailings, *Selenium, Pierre shale, *South Dakota, Arsenic, Surface water, Groundwater, Whitewood Creek(SD), Belle Fourche River(SD), Cheyenne River(SD), Trace elements, *Pollutant identification, Water analysis.

As a result of 100 years of gold mining activity in the northern Black Hills, the waters of Whitewood Creek, Belle Fourche River, and Cheyenne River have anomalous trace element contents. The emphasis of this study was analysis of the arsenic content of ground and surface waters; selected samples were analyzed for selenium. A total of 81 ground-water sampling sites were established; of these, 39 were installed plastic-cased observation wells with the remainder private wells. The arsenic content of 243 samples range from less than 2.5 parts per billion (ppb) to 2000 ppb. Of the 81 sampling sites, water from 14 sites exceeded the drinking water standard of 50 ppb one or more times. Twelve of these sites were located along Whitewood Creek, one along the Belle Fourche River and one along the Cheyenne River. The high arsenic level found in the ground water along Whitewood Creek is thought to result from direct discharge by the creek and/or bacterial oxidation and leaching of the mine tailings deposited on the floodplain. Which mechanism or combination prevails is dependent on the specific site. Selenium analyses were performed on 64 samples. The range was from 0.0 ppb to 3.0 ppb with 12 of the samples exceeding the drinking water standard of 10 ppb. The high selenium values were associated with water wells developed in or near the Pierre shale. The natural background source of the selenium is the shale. (Wiersma-South Dakota)

DEVELOPMENT OF A NEW TECHNIQUE FOR THE ANALYSIS OF PESTICIDES IN WATER,
Kentucky Water Resources Research, Inst., Lexington.
P. K. Kadaba, P. K. Bhagat, R. Osredkar, and V. R. K. Murthy.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-289 370, Price codes: A04 in paper copy, A01 in microfiche. Research Report No 116, 1978. 59 p, 20 fig, 2 tab, 19 ref. OWRT A-065-KY(1). 14-34-0001-6018. 14-34-0001-7037.

Descriptors: *Spectroscopy, Spectrometers, *Trace elements, Pesticides, Organic compounds, Carbamate pesticides, *Pollutant identification, Analytical techniques, Water analysis, *Pesticide residues, *Spectrophotometry, Nuclear Double Resonance Spectrograph, Electronic structure of molecules, Molecular structure.

A Nuclear Double Resonance Spectrograph has been designed and constructed with emphasis on quadrupolar nuclei of half-integral spins. The use of a data acquisition and processing system featuring the A/D converter, signal averager with built in fast Fourier transformation hardware greatly improves the S/N ratio. The spectrograph has been used to detect certain organochlorine, carbamate and symmetrical triazine pesticides. Concentration levels that can be detected range from 15 to 100 micrograms per liter. Since the measurements are done below ice temperatures, heat-liable compounds can be detected without conversion to more suitable derivatives as in gas chromatography. Fats and oils in sample extracts do not interfere with the measurements. Further improvement in sensitivity is possible by using liquid nitrogen-cooled, ferrite-cored electromagnet, by increasing the polarizing field and by reducing receiver recovery time. In addition to analysis of pesticides, the Nuclear Double Resonance technique can be used to study the electronic structure of molecules.

MEASUREMENTS OF PHYTOPLANKTON-PROTEIN CONTENT WITH THE HEATED BIURET-FOLIN ASSAY,
USV Pharmaceutical Corp., Tuckahoe, NY.
T. E. Dorsey, P. McDonald, and O. A. Roels.
Journal of Phycology, Vol. 14, No. 2, p 167-171, 1978. 3 fig, 2 tab, 19 ref. Sea Grant 04-5-158-59.

Descriptors: *Proteins, *Phytoplankton, *Heated biuret-folin method, *Plant growth, *Assay, *Measurement, Algae, Methodology, Analytical techniques, Spectrophotometry, Indicators, Filtration, Nitrogen, Particulates, *Bioassay.

The heated biuret-folin protein assay is shown to be applicable to assays of algal protein in several freshwater and marine phytoplankton species, and is considered a good quantitative measure of algal growth. In this method, a filter containing the algal sample is placed in the bottom of a test tube, 5 ml biuret reagent added (slightly modified to accomodate additional chelating agent), and the contents heated at 100C for 100 minutes before addition of Folin-phenol. The tube is then centrifuged to remove the filter, and the molybdate blue clor measured with a spectrophotometer at 660 nm and compared with identically treated standards. This method consistently measures 90% of the total nitrogen of filtered algal samples as protein-nitrogen without the need of mechanical disruption; data indicate the method measured total protein on all species tested and for naturally occurring mixtures of algae and detritus. Dilute algal suspensions with as little as 0.05 microgram-atom particulate protein-nitrogen/liter can be concentrated by filtration on glass fiber filters to the optimum 1.0 microgram-atom particulate protein-nitrogen per filter. Other assays of algal protein content, including those of Price and of Packard and Dortch, are unsatisfactory for algal species which are difficult to break. Current methods of growth measurement lack the rigid quantification of this method, which is both quantitative and chemically specific. (Lynch-Wisconsin)

5B. Sources Of Pollution

APPLICATION IN THE WATER INDUSTRY OF REGIONAL GEOCHEMICAL MAPS OF ENGLAND AND WALES,
Imperial Coll. of Science and Technology, London (England). Applied Geochemistry Research Group.
I. Thornton, and J. S. Webb.
Journal of the Institution of Water Engineers and Scientists, Vol. 31, No. 1, p 11-25, January 1977. 6 fig, 4 tab, 26 ref.

Descriptors: *Water pollution sources, *Water quality, *Sediments, *Surveys, Metals, Streambeds, Geochemistry, Estuaries, Water pollution, Lead, Maps, Data collections, Areal, Cadmium, Spatial distribution, Arsenic, Copper, Zinc, Streams, Rivers, Foreign countries, *England, *Wales.

Regional geochemical maps of England and Wales have focussed attention on a number of metal-rich areas related to contamination from past base-metal mining and smelting, present-day industrial activity, urbanization, and natural geochemically-anomalous source rocks. Detailed sampling in the soft water environment of southwest England demonstrated an encouraging degree of correlation between metals in sediments and waters and served to confirm the thesis that a knowledge of the chemical composition of stream sediment can prove useful in the prediction of sites where, under certain conditions of rainfall and runoff, the metal load in associated waters may exceed recommended limits. Thus, in certain cases, the sediment may prove a more stable indication of potential metal excess than one-off sampling of the waters themselves. If this is widely true, the geochemical atlas of England and Wales, based on the multi-element analysis of tributary drainage sediments, may be applied usefully by the Water Industry to assist in the selection of key sites for water monitoring programs to help identify those trace elements or metals that require monitoring. The regional geochemical maps constitute a unique source of baseline data, which, it is hoped, will assist in present-day and future assessment of water resources. The atlas has drawn attention to several estuaries where contaminated input drainage has led to a marked enhancement of metals in sediments and waters, which in turn can affect the potential use of estuaries and their waters for shellfish culture. (Humphreys-ISWS)

THE 1976 DROUGHT AND NITRATE LEVELS IN THE RIVER EXE BASIN,
Exeter Univ. (England). Dept. of Geography.
D. E. Walling, and I. D. L. Foster.
Journal of the Institution of Water Engineers and Scientists, Vol. 32, No. 4, p 341-352, July 1978. 6 fig, 3 tab, 19 ref.

Descriptors: *Water quality, *Watersheds(Basins), *Nitrates, *On-site data collections, Droughts, Data collection, Sampling, Analysis, Magnesium, Streamflow, Rainfall, Seasonal, Autumn, Monitoring, Rivers, Foreign countries, Foreign research, *England, *River Exe(England).

The existence of a water quality sampling network within the catchment of the river Exe, in Devon, has provided an apportunity to assess the impact of the 1976 drought and subsequent autumn rainfall on nitrate levels in stream flow. Comparisons were made with data from previous years. Analysis of data collected at different sampling frequencies indicated that the 1976 drought produced a unique pattern of nitrate behavior. Concentrations increased rapidly during the onset of the post-drought rainfall, and levels recorded subsequently

included one case which was over 45 times higher than those previously encountered at that time of year. Concentrations of up to 903.6 mg/l (NO3-N) were recorded at the outlet of a tile drain system. It was suggested that the marked increase in nitrate levels can be related to the influence of the extreme drought conditions on mineralization and nitrification processes within the soil. The Exe basin covers a drainage area of 1,462 sq km and includes a diversity of rock types, ranging from the indurated slates and grits of the Devonian, through the shales and sandstones of the Carboniferous, to the marls, sandstones, and breccias of the Permian and Trias. Mean annual precipitation and runoff vary from over 1,800 mm and 1,500 mm, respectively, in the northern upland area of Exmoor, to less than 800 mm and 300 mm in the lowland area at the head of Exe estuary. Land use varies across the area, with mixed farming characteristizing the lowlands underlain by Permian and Triassic strata, permanent pasture predominating on the Carboniferous outcrop, and the appearance of some moorland on the higher areas of Exmoor. 'THERMAL POLLUTION' OF BODIES OF WATER AND THE HYDROLOGIC ASPECTS OF THE PROBLEM,
T. N. Filatova, M. R. Tsippert, I. A. Zair-Bek, V. A. Misyuk, and V. P. Molitvina.
Soviet Hydrology: Selected Papers, Vol 15, No 4, p 257-264, 1976. 5 fig, 5 tab, 17 ref. Translated from Transactions of the State Hydrologic Institute (Trudy GGI), No 231, p 163-180, 1976.

Descriptors: *Lakes, *Water temperature, *Water pollution sources, *Thermal pollution, Foreign research, Hydrologic aspects, Heated water, Reservoirs, Data collections, Foreign countries, Evaluation, Probability, *USSR.

The planned large-scale development of thermal power engineering threatens bodies of water with so-called thermal pollution because of the discharge into them of waters as 8-12C from the heat exchangers of thermal and nuclear power plants or coolers of industrial enterprises. In the Soviet Union, heated waters are discharged into special reservoirs, multipurpose reservoirs, and lakes. By using statistical methods of computation and generalized water temperature data, the limits of temperature variation and the probability of occurrence of temperatures of a given value can be found. The natural water temperature t was computed for several Russian lakes and reservoirs and was presented in graphs and tables. (Humphreys-ISWS)

THE ADSORPTION OF CHROMIUM (VI) AT THE OXIDE/WATER INTERFACE,
Air Force Civil Engineering Center, Kirtland AFB, NM.
M. G. MacNaughton.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A032 083, Price codes: A03 in paper copy, A01 in microfiche. Report No. AFCEC-TR-75-17, September 1975. 27 p, 8 fig, 2 tab, 34 ref.

Descriptors: *Chromium, *Chemical properties, *Water chemistry, *Water pollution, *Geochemistry, Metals, Chemistry, Trace elements, Chemical wastes, Pollutants, Public health, Water quality, Model studies, Adsorption, Mathematical models, Toxicity, Phosphates, Heavy metals, *Chromium compounds.

Because of its toxicity, chromium has a potential environmental impact, and it is imperative that mechanisms which control the movement of this meta through the environment be known. It has been documented that adsorption to suspended and deposited materials is important in controlling the concentration of heavy metals in natural waters. Numerous previous investigators have been concerned with the adsorption of hydrolyzable heavy metals; however, chromium exists in aqueous solution as the anionic oxocomplex. In this report, data on adsorption of chromium and phosphate were compared at the water interface of various metal oxides. The conclusions of this investigation were: (1) for A1203, both chromium and phosphate adsorb at low pH's; however, upon increasing pH, there is a decrease in the percentage adsorption; (2) chromium adsorption decreases with increasing ionic strength; (3) phosphate exhibits a higher specific adsorption energy than does chromium; (4) adsorption of both chromium and phosphate is low for solids which have isoelectric points at low pH's; and (5) with a more valid method of determining the surface potential other than the Nernst equation, the simple electrical double layer model can be used to give reasonable predictions of the pH and surface charge response for adsorption of anions. (Henley-ISWS)

CONCEPTUAL AND MATHEMATICAL MODELING OF THE HANFORD GROUNDWATER FLOW REGIME,
Atlantic Richfield Hanford Co., Richland, WA.
R. C. Arnett, R. A. Deju, R. W. Nelson, C. R. Cole, and R. E. Gephart.
Available from the National Technical Information Service, Springfield, VA 22161 as ARH-ST-140, Price codes: A06 in paper copy, A01 in microfiche. Report ARH-ST-140, October 1976. 109 p, 13 fig, 1 tab, 58 ref, 1 append. ERDA E(45-1)-2130.

Descriptors: *Groundwater movement, *Water pollution, *Model studies, *Mathematical models, *Columbia River, *Washington, Pollutants, Path of pollutants, Radioactive wastes, Groundwater, Radioactive waste disposal, Computer models, Computer programs, Flow, Geology, *Hanford Atomic Reservation(Wash).

Disposal of radioactive wastes to surface disposal sites at the Hanford Atomic Reservation has resulted in some radioactive and chemical contamination of the underlying groundwater flow systems. In support of the Hanford groundwater management effort, a preliminary conceptual model of the groundwater system was formulated as a first step in understanding possible contaminant movement. The mathematical modeling capabilities needed for better understanding and prediction of such contaminant movement were discussed in this paper; and the state-of-the-art in groundwater modeling as related to Hanford was summarized, with emphasis upon computer solution methods. An inventory of potentially applicable codes available both at Hanford and elsewhere was included. The areas where groundwater modeling capability is lacking were outlined, and the steps needed to overcome such deficiencies were discussed. (Sims-ISWS)

GEOCHEMISTRY OF GROUND WATER, SOUTHWESTERN MISSOURI,
Missouri Univ.-Columbia. Dept. of Geology.
J. M. Darr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-289 231, Price codes: A06 in paper copy, A01 in microfiche. M.A. Thesis, May 1978. 113 p, 28 fig, 17 tab, 60 ref. OWRT A-086-MO(2). 14-34-0001-6026. 7053 and 7054.

Descriptors: *Groundwater, *Water quality, *Brackish water, *Geochemistry, *Missouri, Calcite, Dolomite, Hydrogen ion concentration, Aquifers, Water pollution, Groundwater resources, Water utilization, Groundwater movement, Sampling, Wells, Saline water intrusion, Water table aquifers, Water table, Potable water.

The geochemical and microbiological characteristics of the groundwater in Bates, Vernon, and Barton Counties in southwestern Missouri were investigated in relation to problems involving invasion of aquifers by brackish water. Minerology of Pennsylvania sandstones and limestones in the area were determined by standard methods and water samples were obtained from 70 farm and municipal water supply wells. Analysis of the groundwater data revealed the presence of a northwest-southeast trending salinity gradient, with water in northwest and central parts of the area unsuitable for human consumption. Bacteriological analysis detected sulfate reducing bacteria. Mineral studies showed that water is in equilibrium with calcite and dolomite and suggest that the presence of ferrous iron enhances stability of dolomite relative to calcite. The relationships between dissolved sodium, potassium, magnesium, silica, and pH indicate that the water is in equilibrium with albite, potash feldspar, quartz and illite but not kaolinite. Relationships between dissolved sulfur, carbon, iron, pH, and pE indicate that the groundwater is not a redox equilibrium. The rates amd migration patterns of brackish water established from records from 1966-1975 indicate that movement of selected isochlors is intruding the area along an east-southeast trends, probably in response to regionally reduced water levels resulting from groundwater withdrawal. Further use of groundwater resources in this region by increased industrialization would increase rate of salt water intrusion and the size of area affected. (Majtenyi-IPA)

PREDICTING THE ANAEROBIC DEGRADATION OF ORGANIC CHEMICAL POLLUTANTS IN WASTE WATER TREATMENT PLANTS FROM THEIR ELECTROCHEMICAL REDUCTION BEHAVIOR,
Montana State Univ., Bozeman. Dept. of Chemistry.
R. D. Geer.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-289 224, Price codes: A04 in paper copy, A01 in microfiche. Montana University Joint Water Resources Research Center Research Report Number 95, Montana State University, Bozeman, July 1978. 61 p, 34 fig, 3 tab, 19 ref, 4 append. OWRT A-097-MONT(1). 14-34-0001-7055.

Descriptors: *Anaerobic digestion, *Organic wastes, *Oxidation-reduction potential, *Reduction(Chemical), Waste treatment, Sludge digestion, Electrochemistry, Degradation, Alkylhalides, Aromatic nitro compounds, Iron porphyrins, Rate constants, Methoxychlor, Bifenox, Mirex, Tetrachloronitrobenzene.

The results of this study show the rather general and simple hypothesis, that the redox potential of an organic pollutant along controls its ability to degrade anaerobically, to be incorrect. The results support the concept that reduced iron porphyrins in anaerobic systems mediate the degradation of some specific types of organic compounds. Good data on the rate of degradation of four compounds in sewage sludge were obtained. The rate constants for the alkyl halide types were Mirex, -0.0008 hr-1 and Methoxychlor, -0.40 hr-1. The aromatic nitro containing compounds had rate constants of -0.53 hr-1 for 2,3,5,6-tetrachloronitrobenzene and -0.26 hr-1 for Bifenox. The nitro compounds were reduced to corresponding anilines and did not lose aromatic chlorines. The alkyl halide compounds had a chlorine replaced with a hydrogen. The other types of compounds did not appear to degrade under the experimental conditions. The redox potential of the anaerobic system was important in determining how its degradation proceeds. The tetrachloronitrobenzene did not react if the redox potential of the sludge was less negative than -0.38 volts relative to an SCE electrode. (Hunt-Montana)

HYDROLOGIC CHARACTERISTICS OF COAL-MINE SPOILS, SOUTHEASTERN MONTANA,
Montana Coll. of Mineral Sciences and Technology, Butte.
W. A. Van Voast, R. B. Hedges, and J. J. McDermott.

Available from the National Technical Information Service, Springfield, VA 22161 as PB-289 223, Price codes: A03 in paper copy, A01 in microfiche. Montana University Joint Water Resources Research Center Research Report Number 94, Montana State University, Bozeman, June 1978. 34 p, 9 fig, 4 tab, 13 ref. OWRT A-077-MONT(1). 14-31-0001-4026.

Descriptors: *Aquifer testing, *Transmissivity, *Hydraulic conductivity, *Spoil banks, *Strip-mines, Coal mine wastes, Groundwater, Water quality, Salts, Trace elements, *Montana, Colstrip(Mont), Sarpy Creek(Mont), Decker(Mont), Ft Union, Powder River, Tongue River, Rosebud mine, Big Sky mine.

Coal beds provide water as well as energy because of their generally fractured character. Hydraulic conductivities of saturated spoils are more diverse than those of the undisturbed coal beds but have comparable average values. Aquifer development in mine spoils is greatest near the bases of the spoils where coarse rubble and wasted coal accumulate. Median concentrations of dissolved solids (major constituents) and of some trace elements are higher in waters from mine spoils than in waters from coal beds. The potential for increased dissolved solids is considered the most significant. The data base of spoils' hydraulic conductivities and water qualities developed in this study will be used for development of predictive techniques for application to future mine area. (Hunt-Montana)

METAL CONCENTRATIONS (AS, CD, CU, PB AND ZN) IN SHORTHORN SCULPINS, MYOXOCEPHALUS SCORPIUS (LINNAEUS) AND ARCTIC CHAR, SALVELINUS ALPINUS (LINNAEUS), FROM THE VICINITY OF STRATHCONA SOUND, NORTHWEST TERRITORIES,
British Columbia Research Council, Vancouver.
A. Bohn, and B. W. Fallis.
Water Research, Vol. 12, p 659-663, 1978. 2 fig, 2 tab, 9 ref.

Descriptors: *Metals, *Sculpins, *Cadmium, *Copper, *Lead, *Zinc, Fish physiology, Animal metabolism, Path of pollutants, Size, Standards, Marine fish, Industrial wastes, Canada, Arctic, *Arsenic, *Tissue analysis, *Arctic char, Strathcona Sound, Shorthorn sculpins.

Concentrations of arsenic, cadmium, copper, lead, and zinc were determined in muscle and liver tissues from shorthorn sculpins and landlocked Arctic char collected in the vicinity of Strathcona Sound, N.W.T., prior to industrial activity. The concentration of arsenic in both muscle and liver tissue from shorthorn sculpins displayed a positive correlation to body weight over the entire size range, and substantially exceeded the maximum recommended level for arsenic in marine animal products established by the Canadian Food and Drug Directorate. The concentrations of the other four elements were either not correlated to body weight or else the data were non-linear. No correlation between the metal concentrations and body weight was found in Arctic char. (EIS-Deal)

STUDIES ON THE DECOMPOSITION OF ALLOCHTHONOUS DETRITUS IN TWO SOUTHERN CALIFORNIA STREAMS,
California Univ., Santa Barbara. Dept. of Biological Sciences.
S. D. Hart, and R. P. Howmiller.
Verh. Internat. Verein. Limnol. 19 Stuttgart, November 1975, p. 1665-1674. 6 fig, 10 ref. (California Water Resources Center Project UCAL-WRC-W-492). OWRT A-055-CAL(2).

Descriptors: *Detritus, *Decomposing organic matter, *Streams, Leaves, *California, Water pollution sources, Goleta(Calif), Santa Barbara(Calif).

It is clear from numerous studies that the ecosystems of most undisturbed streams, and to a greater or lesser degree, those of disturbed streams as well, depend upon detritus of terrestrial origin as the primary source of biological energy. Often tree leaves, in relatively intact condition, are an important component of the allochthonous detritus. While a number of investigators have attempted to measur the amount of tree leaves entering streams and the rate of decomposition of leaves within the streams, only a few have considered the question of difference between leaves of various tree species in rate of decomposition and utilization by the stream biota. There has similarly been little effort to compare rates of decomposition of leaves in different streams. This paper discusses the results of a study comparing rates of decompostion of leaves of locally important trees in two southern California streams. (Snyder-Calif, Davis)

A STUDY OF LEACHATE FROM DREDGED MATERIAL IN UPLAND AREAS AND/OR IN PRODUCTIVE USES,
SCS Engineers, Long Beach, CA.
J. L. Mang, R. J. Lofy, J. C. S. Lu, and R. P. Stearns.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A056 897, Price codes: A20 in paper copy, A01 in microfiche. Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, Technical Report D-78-20, June 1978. 435 p, 1 apend, 99 tab, 52 fig, 159 ref.

Descriptors: *Leachate, *Leaching, *Lysimeters, *Dredged material, *Containment areas, *Waste disposal sites.

A laboratory lysimeter study was conducted to determine the composition of subsurface leachates generated from each of five differnet dredged materials, each combined with one of two different subsurface soil profiles. Sixteen 30-cm-diam Plexiglas lysimeter columns were consecutively filled with equal depths of homogeneous, oxidized native soil and anoxic dredged material (total profile of 60 cm). The dredged materials were obtained from various land disposal areas. The primary leaching solution was distilled water (rainwater leach). Other leaching fluids consisted of distilled water acidified to pH 4.5 with sulfur dioxide, hard water buffered with bicarbonate, and leaching fluids containing high organic contents. Results indicate that leachate quality may be governed by both the dredged material and underlying soil. The leachates (interstitial water) from the dredged material tended to show slight time-dependent increases in pH, Eh, total organic carbon, alkalinity, and manganese. Concentrations of soluble total phosphorus, orthophosphate phosphorus, and magnesium remained relatively stable, while soluble organic and ammonium nitrogen, copper, calcium, sodium, and potassium showed continual decreaes in concentration. Cadmium and zinc trends were highly variable during the course of the leaching tests. Chlorinated trends were highly variable during the course of the leaching testes. Chlorinated hydrocarbons (PCB's and chlorinated pesticides) were generally at undetectable levels. (WES)

FEEDLOT POLLUTION: A SOLVABLE PROBLEM.
South Dakota Farm and Home Research, Vol 21, No 2, p 30-31, Spring, 1970.

Descriptors: *Agricultural runoff, *Water pollution, *South Dakota, *Feedlots, Land management, Precipitation(Atmospheric), *Farm wastes, Retention ponds.

While he was a civil engineering graduate student at South Dakota State University, Paul Thormodsgard did research on snow and rainfall runoff from certain feedlots. He deducted that good land management could be a more feasible answer to feedlot pollution than expensive waste treatment. He found that a large ditch and a plowed field between the feedlot and a stream diminished the waste runoff. He also suggested that waste introduced into a stream in times of flood may be diluted by the large amounts of water. Thormodsgard pointed out that feedlot runoff is related to type of precipitation and could be held in retention ponds or possibly in a plowed field until conditions are right for its release. (Sanders-East Central)

SOURCES OF HEAVY METALS IN SEDIMENTS OF THE HUDSON RIVER ESTUARY,
Lamong-Doherty Geological Observatory, Palisades, NY.
S. C. Williams, H. J. Simpson, C. R. Olsen, and R. F. Bopp.
Marine Chemistry, Vol 6, No 3, May 1978, p 195-213, 5 fig, 7 tab, 32 ref.

Descriptors: Environmental effects, *Water pollution sources, Sediments, Estuaries, *Hudson River, Deposition(Sediments), *Heavy metals, Zinc, Copper, Lead, Cesium, Manganese.

Zinc, copper and lead in Hudson River sediments are from three general sources of comparable magnitude; preindustrial natural sources of weathering; diffuse recent contamination throughout the estuary; and sewage, industrial effluent and urban runoff. The distribution of Cs137 corresponds with that of sediments with recent metal contamination, and provides a good indication of the pattern of pollutant metal accumulation. The depth to which pollutant metals are found in Hudson sediments is similar to the depth distribution of Cs137. Amounts of Fe in Hudson estuary sediments was reasonably constant, but Mn concentration varied over an order of magnitude with greater values near the surface in low-salinity and fresh-water areas. Pollutant copper added to the harbor appears to be rapidly deposited in the sediments. (Chilton-ORNL)

USE OF FECAL STREPTOCOCCI AS INDICATORS OF POLLUTION IN SOIL,
Oregon State Univ., Corvallis. Dept. of Microbiology.
H. J. Kibbey, C. Hagedorn, and E. L. McCoy.
Applied and Environmental Microbiology, Vol. 35, No. 4, p 711-717. April 1978, 2 fig, 5 tab, 16 ref. OWRT B-048-ORE(1).

Descriptors: *Soil pollution, *Sewage disposal, Waste disposal, Potable water, *Bioindicators, Water pollution sources, *Streptococcus.

The survival, recovery, and identification of Streptococcus isolates from soil was investigated by (1) examination of survival in soil under different moisture and temperature conditions, (2) evaluation of media combinations for recovering fecal streptococci from soil, and (3) partial identification of isolates from diverse habitats. Cool, moist conditions prolonged the survival of Streptococcus faecalis in soil for at least 12 weeks, whereas freezing was lethal, with the populations being reduced up to 95% when several freeze-thaw treatments occurred. Media evaluations indicated that both the efficiency of recovery and enumeration of the fecal streptococci from soil can be influenced by the combination of media used. Taxonomic data revealed a need to develop procedures to differentiate between isolates of fecal origin and plant-derived streptococci that possess many of the cultural reactions of S. faecalis. Recent fecal isolates exhibited a much greater incidence of multiple antibiotic resistance than soil or vegetation isolates, and this characteristic, coupled with the use of enterococci as indicators of fecal contamination in soil systems, is discussed.

Descriptors: Golf courses, *Arsenicals(Pesticides), *Pollutants, Leachate, Runoff, *Return flows, Sprinkler irrigation, Turf grasses, *Water pollution sources.

A field study was conducted using four lysimeters (each 3 m by 3 m) containing a Tabor sandy loam soil (Udertic Paleustales) and 16 lysimeters containing different sand-soil-peat mixtures, each equipped with a gravel underdrainage system. Bermudagrass (Ckynodon dactylan L.) turf was maintained at a height of approximately 1 cm throughout the investigation. Sprinkler irrigation was used to apply approximately 1 cm of water daily. Tricalcium arsenate was applied on two dates at a rate of 88 kg ha-1. Arsenic was found in significant concentrations in both drainage and runoff from lysimeters. Particularly high concentration (8 ppm As) were found in the drainage from plots previously cored for soil samples. Concentrations of As in the runoff were as great as 14 ppm when a heavy rain occurred shortly after application of Ca3(AsO4)2. Drainage from the plots typically contained 1 to 3 ppm and decreased slowly with time. Arsenic concentrations of 0.8 ppm were still found in the drainage 115 days after application. Concentrations of As in the runoff and drainage from all the plots exceeded acceptable limits for irrigation water established by the U.S. Public Health Service. (Skogerboe-Colorado State)

Descriptors: *Leaching, Golf courses, Nitrogen, *Nitrates, Mixing, Sprinkler irrigation, *Subsurface irrigation, Environmental effects, *Turf grasses, Inhibitors, *Bentgrass, *Nitrapyrin.

The influence of soil mixtures, irrigation systems, and N sources on N leaching was studied in experimental, though functional, golf greens from 1973 to 1976. Sprinkler irrigation was compared with subsurface irrigation. Soil mixtures contained from 60 to 80 percent sand and variable amounts of silt loam topsoil, calcined clay and humus. Nitrogen treatments, included activated sewage sludge, ureaform, ammonium nitrate, 30 percent N solution, anhydrous ammonia and nitrapyrin. Nitrogen leached primarily as NO3-N. Even though about 75 percent of the added was NH4-N, N solution (30 percent N) applied through the subsurface irrigation system caused a sharp increase in NO3-N in the drainage water. Anhydrous ammonia with or without nitrapyrin reduced NO3-N leaching losses for 1 to 2 weeks but had little effect on the average NO3-N concentration over a 47-day period. Subsurface irrigation stimulated turfgrass growth in bands about 20 cm wide located above the irrigation lines. Appearance of growth bands was associated with low temperatures and increased levels of NO3-N in proximity to the irrigation lines. Banding was most apparent in soil mixtures containing low levels of residual soil N and absent when turfgrass was adequately fertilized with N. (Skogerboe-Colorado State)

Descriptors: *Water quality, *Leachate, *Mass transfer model, *Refuse, Solid waste, Waste disposal, *Water pollution sources, *Weathering, *Leaching, Model studies, Precipitation(Atmospheric), Rainfall, Runoff, Nonpoint pollution sources.

In the processes of removal, refinement and disposal of raw materials, large quantities of waste products become exposed to weathering forces. Subsequent percolation, flushing, and oxidation results in the pollution of waterways, low-lying farmlands and underground aquifers with acidity, alkalinity, hardness, heavy metals, and undesirable organic materials such as tannin and lignin. The need for methodology for estimating the chemical nature and quantity of these leachates becomes more compelling as the extraction of natural materials accelerates. In this work a mass transfer model is formulated which describes the leaching of such pollutants from refuse piles. Certain parameters appearing in the model are studied experimentally using an idealized refuse pile constructed of a difficultly soluble solid. Correlations for mass transfer coefficients in trickling flow and in nonuniform mixtures are developed from these experiments. Finally, the model is applied to an actual refuse pile under natural precipitation and weathering conditions and found to adequately represent the pollutant concentrations in the rainfall runoff.

EFFECTS OF THERMAL DISCHARGE UPON A SUBARCTIC STREAM,
Alaska Univ., Fairbanks. Inst. of Water Resources.
R. F. Carlson, T. Tilsworth, and C. Hok.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-289 369. Price codes: A04 in paper copy, A01 in microfiche. Report IWR-49, June 1978. 66 p, 22 fig, 6 tab, 1 ref, 2 append. OWRT B-020-ALAS(1).

Descriptors: Sanitary engineering, Thermal discharge effluents, Water quality, *Alaska, Cold regions, Rivers, *Chena River(Alas), *Thermal pollution, Powerplants, Dissolved oxygen, Temperature, Cooling water.

The Fairbanks Municipal Utilities System power plant uses the Chena River, a subarctic stream, as its primary cooling water discharge source. The heated discharge has a number of effects, the most notable of which is the creation of an extensive downstream open water section during the winter when the river is normally ice covered. The study results showed the following effects: (1) The present MUS thermal discharge does not increase appreciably the temperature of the Chena River because of the relatively small discharge volume compared to the Chena River flow. (2) The discharge causes an open reach of water which varies from 8 to 15 acres during the winter and extends from 1/4 to 1/2 mile downstream. (3) The variation in extent of the open stretch may be controlled by discharge method: a surface spreading scheme results in a faster but more concentrated heat and water vapor rejection, and a direct jet discharge results in the heat and vapor rejection being slightly more spread. (4) A notably beneficial effect of the thermal discharge on the stream is a definite improvement in the DO content of the river as it passes through the MUS discharge reach.

INTERACTION OF CHLORINE AND ORGANIC MOLECULES--EFFECTS OF INORGANICS
Rhode Island Univ., Kingston. Coll. of Pharmacy.
Y. Shimizu.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-289 39. Price codes: A02 in paper copy, A01 in microfiche. Rhode Island Water Resources Center Final Report, 1978. 18 p, 12 fig, 4 ref. OWRT B-07 RI(1), 14-34-0001-7184.

Descriptors: *Chlorination, Amino acid, Ferric ons, Manganese ions, Catalysts, *Chlorine, *Organic molecules, *Chemical reactions, *Phenylalanine, Waste water treatment, Organic matter.

The effects of heavy metal ions, particularly ferric and manganese ions on reactions of organic molecules and chlorine in aqueous media were studied. The conversion of amino acids (phenylalanine) to the corresponding aldehydes and nitriles by chlorine treatment was remarkably enhanced in the presence of ferric ion. In particular the enhancement was more evident with the nitrile compound production. The result implies that both the rates and courses of reactions between organics and chlorine (hypochlorite) can be altered greatly in the water containing a high concentration of ferric ion. Also it implies a rapid depreciation of active chlorine in such water. No catalyzing effect was observed with manganese ion.

COMPUTER MODEL FOR PREDICTING POLLUTION IN THE MISSOURI,
Missouri Univ.-Columbia. Dept. of Civil Engineering.
H. Liu, and H-D. Cheng.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-289 392, Price codes: A06 in paper copy, A01 in microfiche. Missouri Water Resources Research Center, Completion Report, November 15, 1978. 93 p, 40 fig, 7 tab, 47 ref, 2 append. OWRT A-103-MO(2), 14-34-0001-8027.

Descriptors: Accidental spills, Dispersion, Dispersion coefficient, Fickian model, Dispersion, Modified Fickian models, Non-Fickian models, Pollution forecasts, Rivers, River pollution, Streams, Water pollution sources, *Model studies, *Computer models, *Forecasting, *Missouri.

Whenever there is an accidental spill of hazardous chemicals or radioactive materials into any river, it is vitally important to be able to issue an immediate forecast of the arrival time and peak concentration of a pollutant at each downstream city, to enable water users downstream to take effective precaution measures. Adequate forecast of this type was not possible in the past because of the lack of a proper model to predict one-dimensional dispersion in natural streams. This study resulted in the development of an improved model. The new model is a modified Fickian model which uses a time-dependent dispersion coefficient, a time-scale much greater than the Fischer time-scale, and a Pearson-Type-III distribution of concentration.

OCCURRENCE OF IRON BACTERIA IN GROUND WATER SUPPLIES OF ALABAMA,
Auburn Univ., AL. Water Resources Research Inst.
E. Valkenburg, R. Christian, and M. Green.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-289 575, Price codes: A04 in paper copy, A01 in microfiche. Geological Survey of Alabama Circular 96, 1975, 19 p, 11 fig, 5 tab, 38 ref, 2 append. OWRT B-045-ALA(2).

Descriptors: *Iron bacteria, *Water wells, Groundwater, Water supply, *Alabama, Water pollution sources, Sampling, *Gallionella, Sphaerotilus.

A state-wide survey was conducted in Alabama to determine the occurrence and the distribution of iron bacteria in water wells and to obtain information useful in alleviating problems caused by these organisms. Of 109 well water samples, 59 (54 percent) contained Gallionella and 33 (30 percent) contained Sphaerotilus-like sheaths as revealed by microscopic examination. Of the 59 microscopical-positive samples for Gallionella 23 (39 percent) yielded cultures. At least one type of iron bacteria was identified in 27 of the 35 counties where samples were collected. These organisms were found in 54 wells, in 3 streams, in surface deposits around 2 springs and 8 wells, and there was evidence that they were present in some soils. Only future experimentation will determine whether a chemical 'cure' for wells is feasible. It is recommended that drillers use clean drilling water, circulation tanks, normal development techniques, and disinfection of completed or repaired wells to prevent future iron bacteria inoculation.

GEOCHEMICAL INTERPRETATION OF KINGS MOUNTAIN, NORTH CAROLINA, ORIENTATION AREA,
Du Pont de Nemours (E. I.) and Co., Aiken, SC. Savannah River Lab.
V. Price, and R. B. Ferguson.
Available from the National Technical Information Service, Springfield, VA 22161 as DP-MS-77-10, Price codes: A02 in paper copy, A01 in microfiche. Report No. DP-MS-77-10, March 1977. 17 p, 14 fig, 2 tab, 16 ref. ERDA AT(07-2)-1.

Descriptors: *Geochemistry, *Uranium radioisotopes, *Sediments, *North Carolina, *Geology, *Chemical properties, Trace elements, Water chemistry, Chemical analysis, Analytical techniques, Neutron activation analysis, Instrumentation, Analysis, Testing procedures, Testing, *Uranium, *Kings Mountain(NC), *Uranium compounds, *Uranium monazite, Stream sediments, Uranium exploration.

The Kings Mountain area was chosen for study primarily because of the reported presence of high-uranium monazite. This 750 sq mi area is in the deeply weathered southern Appalachian Piedmont and spans portions of the Inner Piedmont, Kings Mountain, and Charlotte geologic belts. Along the Inner Piedmont-Kings Mountain belt boundary, lithium is being mined; and tin, beryllium, and mica have been mined from pegmatites. Uraninite has been reported from one mica mine. The Cherryville Quartz Monzonite of the Inner Piedmont is the reputed source of Li-BE pegmatites. Uranium concentration maps for -100 to +200 mesh stream sediments indicate the area of monazite abundance. Several samples with more than 100 ppm uranium content appear to be high in uranium-rich resistate minerals. When the uranium content of sediment samples is ratioed to the sum of Hf, Dy, and Th, the anomaly pattern shifts to coincide with uranium highs in ground and surface water samples. False anomalies from concentrations of monazite (Ce, ThPO4), xenotime (Y, DyPO4), and zircon (Zr, HfSiO4) in stream sediment samples thus can be eliminated. Residual anomalies should be related to unusual uranium enrichment of these common minerals or to the presence of an uncommon uranium-rich mineral. Tantalum, beryllium, and tin in stream sediments correspond to high concentrations of uranium in stream and groundwater, but not to uranium in sediments. In an initial reconnaissance, several media should be sampled, and it is essential to correct uranium in sediments for the sample mineralogy. (Henley-ISWS)

BIODEGRADATION OF OIL SLICKS IN THE MARINE ENVIRONMENT,
Rutgers - The State Univ., New Brunswick, NJ. Dept. of Biochemistry and Microbiology.
R. Bartha.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A031 739, Price codes: A02 in paper copy, A01 in microfiche. Report No. N00014-67-A-0115-0005, November 1, 1976. 14 p, 31 ref. ONR N00014-67-A-0115-0005.

Descriptors: *Oil spills, *Microbial degradation, *Oil pollution, *Water pollution treatment, Oil, Fuels, Oil wastes, Water pollution, Marine microorganisms, Water quality, Biodegradation, Pollutants, Nutrients, Fertilization, Orgaic compounds.

The degradation of petroleum hydrocarbons by marine bacteria was studied, with the ultimate aim of using this process in the cleanup of polluting oil. Hydrocarbon-utilizing marine bacteria were isolated, and their growth requirements and metabolic pathways were studied. Enzymatic and regulatory mechanisms responsible for the recalcitrance or delayed utilization of certain hydrocarbons, e.g., polynuclear aromatics and highly branched isoalkanes, were identified. The abundance and distribution of hydrocarbon degrading bacteria were measured in New Jersey coastal waters. The limiting factors of oil biodegradation in the marine environment were studied. Besides the nature of the oil itself, water temperature and mineral nutrients (N, P, Fe) were found to be the most important limiting factors. Given favorable water temperatures, the rate of oil biodegradation can be increased by an order of magnitude or more by supplying the above mineral nutrients to a floating oil slick in oil-soluble (oleophilic) form. This method of application prevents nutrient loss by dilution and does not trigger algal blooms. The patented procedure was considered to be a new cost-effective way to cleanup oceanic oil spills. THE CONTRIBUTION OF MERCURY AND CHLORINATED ORGANICS FROM URBAN RUNOFF,
O'Brien and Gere Engineers, Inc., Syracuse, NY.
C. B. Murphy, Jr., and D. J. Carles.
Water Research, Vol. 12, No. 8, p 531-533, 1978. 3 fig, 1 tab, 4 ref.

Descriptors: *New York, *Mercury, *Chlorinated hydrocarbon pesticides, *Urban runoff, *Combined sewers, Rainfall intensity, Rates, Antecedent precipitation, Suspended solids, Sampling, On-site investigations, Toxins, Correlation analysis, Overflow, Annual loadings, Rainfall duration.

The concentration of mercury and chlorinated organics in the combined sewer overflows of Rochester, New York, was measured. The resulting annual loadings of 0.034 kg/ha (0.034 pounds/acre) and 0.011 kg/ha (0.01 pounds/acre) of mercury and chlorinated organics measured in urban runoff are significant. A high degree of correlation exists between the measured concnetration of the toxicants when compared with rainfall intensity, rainfall duration, antecedent number of dry days, and the total suspended solids concentration characteristic of the combined wastewater. EVALUATION OF SULFATE WATER QUALITY IN THE NORTH-CENTRAL KENTUCKY KARST,
Bethel Research Association, Louisville, KY.
A. I. George.
In: Hydrologic Problems in Karst Regions; Pro-

ceedings of Symposium held at Western Kentucky University, Bowling Green, Kentucky, April 26-29, 1976. Department of Geography and Geology, Western Kentucky University, Bowling Green, Kentucky, p 340-356, 1977. 10 fig, 3 tab, 33 ref.

Descriptors: *Karst, *Water quality, *Kentucky, *Groundwater, Caves, Geomorphology, Aquifers, Carbonate rocks, Sulfates, Limestones, Carbonates, Mineralogy, Spatial distribution, Areal, Maps, Data collections, Petrology, Evaporites.

Sebkha lithology in the North-Central Kentucky Karst is responsible for the distribution of a high sulfate water quality enclave. The highest concentration of sulfate groundwaters (22-1350 mg/l) exists as a lozenge-shaped enclave positioned over the northwest trending, up dip, zero edge of the lower St. Louis evaporite interval. Interstratal karstification is subroding these evaporite beds and producing high dissolved sulfates. Found throughout the mid-Mississippian Plateau karst at the Salem-St. Louis Limestone contact are: calcareous tufa aprons, dams, and/or marl (algal) biscuits. They may indicate the position of a neo-paleogenic high sulfate karstic resurgence. Certain rare cave occurring sulfates--epsomite, hexahydrite, blodite, mirabilite, and authigenic gypsum, barite, and celestite--have been described from the Flint-Mammoth supersystem. This is the same suite of sulfate minerals known from recent and fossil sebkhas. Barite and celestite filled geodes occur east of the sulfate enclave in the Muldraugh Member. It is possible that the Mississippian sebkhas are the common source of sulfates both to the Muldraugh Member and to sub-sediments in cave passages. (See also W79-01932) (Humphreys-ISWS)
W79-01966

CHLORIDE ION VARIATIONS IN SOME SPRINGS OF THE GREEN-BRIER LIMESTONE KARST OF WEST VIRGINIA,
West Virginia Univ., Morgantown. Dept. of Geology and Geography.
E. Werner.
In: Hydrologic Problems in Karst Regions; Proceedings of Symposium held at Western Kentucky University, Bowling Green, Kentucky, April 26-29, 1976. Department of Geography and Geology, Western Kentucky University, Bowling Green, Kentucky, p 357-363, 1977. 3 fig, 3 tab, 5 ref.

Descriptors: *Karst, *Water quality, *West Virginia, *Springs, Groundwater, Limestones, Chlorides, Ions, Variability, Water pollution, Salts, On-site investigations, Data collections, *Pocahontas County(WVa), Road salts.

Chloride ion levels were measured in a number of karst springs in northern Pocahontas County, West Virginia, to determine spatial and temporal variations. A fish hatchery derives its water supply from a number of the springs, some of which derive water from streams draining the major highway of this area, and there is some concern about pollution of the springs by road salt. There are severeal drainage basins nearby which differ only in that they do not have a highway, and thus they can be used for comparison purposes. Chloride values did not reach damaging levels in any of the springs during the course of this study. Short period high levels were measured during snowmelt times in the springs draining the highway. These springs also exhibit year-round levels considerably higher than nearby basins without highways. These high levels are attributed to a transfer of chloride-laden water from the surface to the subsurface diffuse flow system during the winter, and a transfer from the diffuse system to the subsurface conduit system throughout the year, with storage in the diffuse system for periods of on the order of one year. (See also W79-01932) (Humphreys-ISWS)
W79-01967

ROAD SALTS AND QUALITY OF GROUNDWATER FROM A DOLOMITE AQUIFER IN THE CHICAGO AREA,
Illinois Univ. at Chicago Circle. Dept. of Geological Sciences.
Z. A. Saleem.
In: Hydrologic Problems in Karst Regions; Proceedings of Symposium held at Western Kentucky University, Bowling Green, Kentucky, April 26-29, 1976. Department of Geography and Geology, Western Kentucky University, Bowling Green, Kentucky, p 364-368, 1977. 1 fig, 11 ref.

Descriptors: *Water quality, *Illinois, *Dolomite, *Groundwater, Aquifers, Water pollution, Chlorides, Ions, Salts, Data collections, On-site investigations, *Chicago(Ill), Road salts.

The use of deicing salts during periods of snowfall and highway icing has been continuously increasing since about 1940 in higher latitude areas of the U.S. and other parts of the world. This increased usage has resulted in the impairment of quality of surface and groundwaters of many areas. The quality of surface water and the carbonate groundwaters of a basin in the Chicago Metropolitan area was investigated during the last four years (1972-1975). A comparison of the groundwater quality data with data gathered between 1931 and 1961 shows that concentrations of all ions have increased. Chloride and sodium ions show the largest increases. The largest increase is in the area where the overburden is thinnest. The water quality also varies from season to season. The increases in concentraions of chloride and sodium ions and spatial variations in their concentrations were attributed to highway deicing chemicals, mostly sodium chloride. HEAVY METAL ADDITIONS TO WATERS OF THE JOPLIN AREA, TRI-STATE MINING DISTRICT, MISSOURI,
Missouri Univ.-Rolla
P. D. Proctor, G. Kisvarsanyi, and E. Garrison.
In: Hydrologic Problems in Karst Regions; Proceedings of Symposium held at Western Kentucky University, Bowling Green, Kentucky, April 26-29, 1976. Department of Geography and Geology, Western Kentucky University, Bowling Green, Kentucky, p 369-387, 1977. 10 fig, 2 tab, 21 ref. OWRT B-054-MO(2).

Descriptors: *Aquifers, *Water quality, *Missouri, *Heavy metals, *On-site data collections, Water supply, Groundwater, Surface waters, Water pollution, Zinc, Lead, Copper, Cadmium, Iron, Mercury, Water wells, Springs, Alkalinity, Hydrogen ion concentration, Water analysis, Chemical analysis, Stratigraphy, Sampling, On-site investigations, Karst, *Joplin(Mo).

Joplin, Missouri, population 40,000, in part of the world-renowned Tri-State Mining District, obtains water mainly from Shoal Creek. Webb City and Carterville share a common water supply from wells. Other nearby towns in the area have independent water supplies from wells. Waters come from deep aquifers of Cambrian and Ordovician age. Outside the cities, individual residences obtain water from shallow aquifers of Mississippian age. These age rocks are host to large zinc-lead ore deposits. The rocks in the area are mainly flat-lying, though local broad folds of westerly to northwesterly trend pitch northwest. Faults of similar trend, and with stratigraphic displacements to 300 feet, cut these rocks. Zinc sulfides, together with lead, copper, iron, and minor cadmium sulfides, remain in pillars, and lesser quantities in wall rock and in the extensive mine dumps in the mining area surrounding these cities. A set of dry fall-early winter water samples from a 100 sq mi area around Joplin included 10 deep well, 24 shallow well, 12 stream, 3 spring, and 3 open-pit lake samples. A second set from the same localities was collected in wet spring-early summer. All samples were analyzed for heavy metal (Pb, Zn, Cu, Cd, Fe, Hg) and alkali content by atomic absorption techniques. Alkalinity, pH, and temperature also were determined. Surface waters have average zinc content (542 ppb), about one-half that of the shallow wells and 15 times that of the deep wells. Mean cadmium content (2 ppb) is similar for surface and shallow wells and three times higher than deep wells. Both copper (8 ppb) and lead (3 ppb) have greater average content in the shallow well environment. Average iron content is highest in deep wells (112 ppb), next in shallow wells. Calcium (76 ppm), magnesium (4.1 ppm) and sodium (8.7 ppm) have similar average content in the surface-near surface waters. Waters in the older dolomitic rocks in the deep wells have lesser calcium and almost 5x as much magnesium. Potassium (2.2 ppm) shows about 1 ppm variation in the surface-near surface-deep well environment. Dry fall water samples have higher mean values than wetter season water samples. For the related seasonal water samples in the 100 sq mi area around Joplin, some 25% of the shallow well water samples, 10% of the deep well samples, and 16% of the surface water samples exceeded the recommended Public Health Service drinking water standards for one or more heavy metals. When compared to Missouri effluent standards, most water samples exceed the ratio of 1.0 for heavy metals. An alternate water supply exists in the deep aquifer zone of the Cambro-Ordovician rocks. W79-01969

GROUND WATER POLLUTION OF A LIMESTONE AQUIFER BY CAUSTIC WASTE,
Geological Survey of Jamica, Kingston. Water Resources Div.
L. A. Wedderburn.
In: Hydrologic Problems in Karst Regions; Proceedings of Symposium held at Western Kentucky University, Bowling Green, Kentucky, April 26-29, 1976. Department of Geography and Geology, Western Kentucky University, Bowling Green, Kentucky, p 388-404, 1977. 4 fig, 3 tab, 5 ref.

Descriptors: *Water pollution, *Karst hydrology, *Waste disposal, *Aquifers, Limestones, Karst, Hydrogeology, Ponds, Groundwater, Foreign countries, Foreign research, Sodium, Iron, Alkalis(Bases), Ions, Infiltration, On-site investigations, On-site data collections, *Jamaica, Alumina, waste disposal.

Caustic waste known locally as 'red mud' produced from the Bayer process for extraction of alumina from Jamaican bauxite is ponded in karstic depressions where it may infiltrate to the ground water table. As discharged from the plant, the red mud has a water content of 75% to 85%, but due to the small, almost colloidal solid particles in suspension, settles slowly to about 35% clear supernatant liquid. The pollutants present in the waste (sodium ions, iron hydroxide, organic substances) are in quantities sufficient to make the groundwater unfit for domestic, agricultural, and some industrial uses. Analysis of groundwater in the vicinity of these disposal sites indicated that at 2 of the 5 sites at which the process is carried out pollution of groundwater has taken place. Waste disposal ponds are located on karstified limestone which have high vertical permeability and are in the direct path of groundwater flow to major groundwater reservoirs; consequently they pose a serious threat to the groundwater reserves of the Island. Remedial actions suggested include better pond management, reduction of caustic and other contaminants in the waste, and groundwater abstraction from the affected areas to contain the spread of the pollutant. SUBSURFACE WATER BEHAVIOR AND SEWAGE EFFLUENT IRRIGATION IN THE MISSOURI OZARKS,
Missouri Univ., Columbia, School of Forestry, Fisheries and Wildlife.
L. C. Tennyson, and C. D. Settergren.
In: Hydrologic Problems in Karst Regions; Proceedings of Symposium held at Western Kentucky University, Bowling Green, Kentucky, April 26-29, 1976. Department of Geography and Geology, Western Kentucky University, Bowling Green, Kentucky, p 411-418, 1977. 5 fig, 2 tab, 10 ref.

Descriptors: *Waste water disposal, *Irrigation, *Missouri, *Monitoring, Subsurface waters, Sewage effluents, Sprinkler irrigation, Water pollu

on sources, Vadose water, Groundwater, On-site sts, Methodology, Water quality, Karst, Water vels, Phosphorus, *Missouri Ozarks.

ne use of land sites in karst terrain for disposal of astewater has generated an area of controversy recent years. Karst groundwater supply systems e often highly vulnerable to contamination from traneous sources such as waste effluents. This udy was designed to investigate the effects of wage effluent irrigation on the subsurface water a land disposal site in the Southern Missouri zarks. Groundwater and vadose water were onitored to evaluate the renovation potential and ater table behavior on a land disposal site. A rest bottomland site was sprinkler irrigated with eated sewage effluent at application rates of 5.1 n/week and 11.9 cm/week. Ammonium nitrogen vels in vadose and groundwater increased during e 11.9 cm/week schedule. Phosphorus concen- ations were not affected by a change in irrigation te; however, renovation of effluent phosphorus as occurring. Groundwater level and response ne varied with the rate of application of effluent. roundwater level response to irrigation ranged om 0.5 hours to 6.0 hours. Higher irrigation rate oduced a shallower water table, a decrease in sponse time, and an increase in ammonium nitro- n. (See also W79-01932) (Humphreys-ISWS)

e Bowden National fish hatchery is the most oductive trout hatchery in the United States. e Bowden Hatchery began operations in 1960, d up until January, 1975, it had no problems th water supply. The water supply consists of o karst springs, the North Spring and the South ring, with an average combined yield of 2,000 llons per minute. In times of low flow the Shav- Fork River is also used. Construction began on Elkins-to-Bowden segment of Corridor-H, a t of interstate highway 79, in 1972. In January 75, excavation operations near Bowden Hatch- began to uncover pits and caverns. This result- in large quantities of clay and silt being washed o the caverns. Since the caverns are conduits to South Spring, This spring became very turbid ring storms. In one incident more than 150,000 ut died due to silt build-up on their gills which ulted in asphyxiation. Numerous fish kills oc- red throughout 1975, as well as fish poisoning diesel fuels which were spilled on the construc- n site and washed into the caverns. In addition turbidity, the newly discovered conduits were eaded, resulting in reduced flows of the South ring and near by wells. This study was under- e for the Fish and Wildlife Service to determine extent of damage to the hydrogeologic envi- nment of the South Spring, and to determine if nage might occur to the North Spring as road nstruction continues. It was determined by this dy that future road construction will adversely ect the North Spring in both quantity and qual- of the water. (See also W79-01932) (Hum- reys-ISWS)

Descriptors: Water quality, Urban pollution, *Trace metals, Sediment dating, *Lake sediments, Lead, Zinc, Copper, *Washington, Urbanization, Water pollution sources, Lakes, Chemical analysis, Radioactive dating, *Sedimentation rates.

Contemporary and historical loadings of lead, zinc and copper to the profundal sediments of Lakes Washington, Sammamish, Chester Morse and Findley were determined using chemical analysis and 210Pb dating of sediment cores. Elemental sedimentation rates, a cross product of the sedimentation rate and sediment concentration of a given element, were corrected for natural background concentrations and rates, and extrapolated across established sediment accumulating areas to give a conservative estimate of the pollutional trace metal loadings to each lake. The resulting chronological loadings appeared consistent with the known cultural history of the individual watersheds. Substantial alterations in sedimentation rates were noted in all lakes where deforestation, road building, suburbanization or urbanization had occurred in the lake's watershed. The quantities, elemental ratios and pollutional histories of copper, lead and zinc in the lake sediments indicate that aeolian inputs are the dominant source of trace metal pollution to the lake sediments at the present time. Pollutional loading rates of all three metals followed the gradient Washington > Sammamish > Chester Morse > Findley consistent with a gradient of cultural use intensities from extremely urban to wilderness.

Descriptors: *Animal parasites, *Larval growth stage, *Irrigation effects, Pasture management, On-site data collections, Dictyocaulus viviparus, Bovine lungworm larvae, *Montana.

Field and laboratory studies were initiated in November, 1975 and continued through November, 1977 to determine the effect of supplementary water applied periodically to pasture plots on the survival of bovine lungworm larvae (Dictyocaulus viviparus). Concurrent observations were made of larval survival on dry land plots which received only natural precipitation. Irrigation had a substantial effect on prolonging larval survival on field plots in which pasture vegetation was artificially reduced to a height of about 3 in. to simulate the effect of grazing or hay harvest. After 35 days, approximately twice as many viable larvae were present on unclipped as compared with clipped lots. Studies on the distance and rate of lateral larval migration on pasture plots indicated that the maximum distance that lungworm larvae moved from their point of origin was 3 in. Lateral movement took place only during the first 48 hrs. after larval deposition on pasturem herbage. Although it was not possible to make direct correlations between meteorologic conditions and larval survival rates, it was found that high soil moisture levels maintained by irrigation stimulated plant growth which in turn created a wind barrier near the ground which reduced wind velocity and maintained relative humidity, potential evaporation and soil moisture at higher levels than in nonirrigated areas.

Descriptors: *Water pollution, *Environmental effects, Water quality, Erosion, Flood plain management, Bank erosion, Urban drainage, *Stream surveillance, *Biological health of streams.

Streams in urbanizing areas are subject to a variety of stresses produced by the processes of growth; most of the resulting changes are environmentally adverse. Unfavorable conditions may be improved by various government programs, such as flood control and water pollution control. However, before remedial programs can be adopted, the problems and the processes which create them must be understood. Water quality and discharge of the larger rivers are monitored by a network of USGS/State gaging stations. However, small streams are so numerous, and conditions in them change so rapidly that conventional monitoring networks cannot deal with them. Moreover, the condition of such streams is more accuractely monitored by biological evaluations than by measurements of the usual water quality parameters. Therefore, a stream surveillance program has been devised to evaluate the biological health of streams, the pollution sources to which it is subject, and certain other physical conditions relevant to management. These include symptoms of stream

encroachment, channel erosion or filling, and obstruction to flow, either natural or artificial.

NUTRIENT CYCLING AND PRODUCTIVITY OF DYSTROPHIC LAKE-BOG SYSTEMS (PART A), APPENDIX A: IN SITU EXPERIMENTS ON THE DISSOLVED AND COLLOIDAL STATE OF IRON IN AN ACID BOG LAKE,
Michigan Univ., Ann Arbor. School of Natural Resources
J. P. Koenings.
Publication No. 016440-7-T, December 1975. 2 fig, 3 tab, 25 ref. AT(11-1)-1771.

Descriptors: *Iron, *Bogs, *Lakes, Acidic water, Colloids, Particle size, Dissolved solids, *Michigan, Meromixis, Oxidation, Epilimnion, Hypolimnion, Methodology, Analytical techniques, Tracers, Filtration, Dialysis, *North Gate Lake(MI), Bathyophenanthroline.

Iron compounds in the epilimnion and hypolim- [illegible] County, MI, were fractionated and characterized to assess effects of oxidizing and reducing environments on potential colloidal organic matter (COM)- iron complexation. North Gate Lake, pH 4-5 is a small, highly stained, meromictic bog lake with a surface area of about 0.4 ha and a maximum depth of 8 m. The open water is surrounded by a Sphagnum mat. Iron fractions were chemically separated by reactivity to bathyophenanthroline (BPN) after specific digestion procedures, and physical separation was accomplished by means of a plastic anaerobic in-situ filtration sampler (450 nm), and in-situ dialysis (4.8 nm). Three sizes were isolated particulate, colloidal, and dissolved. Colloidal-size reactive ferric iron predominated in the oxygenated epilimnion, while dialyzable or dissolved ferrous iron increased with depth. Organic matter was present in a nontransient colloidal state. Inorganic nonreactive iron species such as Fe(OH)3 comprised only a small fraction of total iron, unlike pH 6-8 lakes. In acid bog lakes, ferric iron is not colloidal as an inorganic complex, OH(-), but colloidal as reactive Fe(+3) by complexation with the colloidal organic acids. After thermally-induced mixing with anaerobic waters, ferric iron is reduced and dissolved. The presence of a residual ferrous organic complex is suggested, however, by the fact that some of the BPN-reactive iron remains colloidal. (See also W78-02510) (Lynch-W sconsin)
W79-01597

NUTRIENT CYCLING AND PRODUCTIVITY OF DYSTROPHIC LAKE-BOG SYSTEMS (PART A) APPENDIX B: THE INFLUENCE OF COLLOIDAL ORGANIC MATTER (COM) UPON IRON AND IRON-PHOSPHORUS CYCLING IN AN ACID BOG LAKE,
Michigan Univ., Ann Arbor. School of Natural Resources.
J. P. Koenings, and F. F. Hooper.
Publication No. 016440-7-T, December 1975. 6 tab, 26 ref. AT(11-1)-1771.

Descriptors: *Iron, *Phosphorus, *Bogs, *Cycles, *Lakes, *Michigan, Nutrients, Acidic water, Colloids, Organic matter, Meromixis, Dialysis, Filtration, Tracers, Stratification, Dissolved solids, *North Gate Lake(MI), Bathophenanthroline.

The influence of yellow colloidal organic matter (COM) on iron-phosphorus associations in a bog lake, and indirect consequences of this interaction, are described. The study was conducted in a small, acid meromictic bog lake, North Gate Lake, Gogebic County, MI, which has a surface area of about 0.4 ha and a maximum depth of 8 m; the open water is surrounded by a Sphagnum mat. Mechanical separation of particulate, colloidal, and dissolved forms of iron and phosphorus from water was made by filtration and dialysis. Bathophenanthroline (BPM) was used for measuring ferrous iron. Mixing in the lake occurs only to a depth of 5-6 m, leaving a monimolimnion which is never oxygenated below 6.5-7.0 m. The 5-m depth is usually anaerobic, while the 2-m depth alternates between very low oxygen and anaerobic conditions. The surface is always oxygenated, but only at 50-70% saturation. BPN-reactive ferrous iron existed in true solution in the anaerobic monimolimnion, whereas in the aerobic epilimnion reactive ferric iron was colloidal. Intermediate depths contained two BPN-reactive forms of ferrous iron--dialyzable Fe(+2) and colloidal Fe(II), which may be present as a COM-Fe(+2) complex. COM concentration had important effects on dialyzable Fe(+2) and dialyzable orthophosphate in anaerobic strata prior to aeration, and appeared to mask cationic properties of colloidal ferric iron and to retard formation of nonreactive Fe(III). IMPACT OF RESIDUAL BIOSOLIDS ON RECEIVING WATER QUALITY,
H. S. Costa, D. L. Borton, and J. J. McKeown.
Presented at TAPPI Environmental Conference, Washington, D.C., April 12-14, 1978, Preprinted Proceedings (TAPPI, Atlanta, Georgia 30338), p 57-62. 3 fig, 15 ref, 1 tab.

Descriptors: *Pulp wastes, *Water pollution effects, *Water quality, *Aquatic life, Wastes, Industrial wastes, Water pollution sources, Pulp and paper industry, Suspended solids, Fish, Aquatic insects, Food chains, Bottom sediments, Biological treatment, Aquatic animals, Pollutants.

A review is presented of studies undertaken by the U.S. pulp and paper industry to determine the impact of nonsettleable solids of biological treatment origin on the aquatic community and their fate in receiving waters. At levels occurring in receiving waters, nonsettleable solids do not generate detectable benthic deposition, do not harm fish raised in their presence, and do not alter the composition of the aquatic insect community. Nonsettleable solids are shown to enter the food chain by ingestion and incorporation into cellular material of aquatic insects. The questions raised regarding the significance of their presence in the environment seem to have been satisfactorily answered and the need for control technology beyond that already achieved is not evident. (Swichtenberg-IPC)

Presented at TAPPI Environmental Conference, Washington, D.C., April 12-14, 1978, Preprinted Proceedings (TAPPI, Atlanta, Georgia 30338), p 157-163. 1 fig, 1 illus, 7 ref, 7 tab.

Descriptors: *Pulp wastes, *Food chains, *Suspended solids, *Aquatic life, Effluents, Wastes, Industrial wastes, Water pollution sources, Activated sludge, Aerated lagoons, Air, Oxygen, Clays, Caddisflies, Insects, Aquatic insects, Foods, Larva, Daphnia, Zooplankton, Pulp and paper industry.

Studies conducted at the Institute of Paper Chemistry (Appleton, Wisconsin) showed that nonsettleable solids discharged from oxygen-activated and air-activated sludge and aerated lagoon effluent treatment systems were 40-65% biological in nature of which between 5 and 35% was viable. Viability was greater in summer than in winter samples, with the largest variation evident for the aerated lagoon treatment system. Nonbiologic material included inorganic clay and coating materials. The great majority of particles were less than 2 micrometers in diameter and represented 35-58% of the volume. The total range of particle size spanned 1-16 micrometers. The nonsettleable solids were used as food by large caddis fly (Hydropsyche walkeri) larvae, however, smaller larvae were unable to utilize these materials. Daphnia sp, a common filter-feedng zooplankton, also demonstrated the ability to utilize nonsettleable solids as an adequate food source. (Swichtenberg-IPC)

BIOLOGICAL IMPACT OF VARIOUS CHLORINATED PHENOLICS AND RELATED COMPOUNDS ON DAPHNIA MAGNA,
State Univ. of New York Coll. of Environmental Science and Forestry, Syracuse.
P. R. Durkin.
Presented at TAPPI Environmental Conference, Washington, D.C., April 12-14, 1978, Preprinted Proceedings (TAPPI, Atlanta, Georgia 30338), p 165-169. 16 ref, 2 tab.

Descriptors: *Bleaching wastes, *Water pollution effects, *Daphnia, Wastes, Industrial wastes, Pulp and paper industry, Pulp wastes, Lethal limit, Daphnia magna, Aquatic animals, Aromatic compounds, Organic compounds, Toxicity, Water pollution sources, Phenols, Equations, Zooplankton.

Acute lethal and sublethal responses in Daphnia magna were used to evaluate the toxicity of methoxy-substituted aromatic model compounds of the toxic components of kraft bleach plant effluent, viz., spent chlorination liquor. A series of chlorinated methylcatechols, methylveratroles, and methoxymethylphenols were selected for study. Quantitati

nemical structure vs. biological activity correla-
ons were made between both acute lethal and
radycardic potencies and aromatic substituent
onstants, viz., the lipophilic, the electron field and
esonance, and molar refractivity parameters. Both
pes of biological responses could be described by
general equation giving correlation coefficients
more than 0.9. However, structure vs. activity
uations using fewer parameters suggested that
e relationship between bradycardia and lethality
as incidental rather than intrinsic. The relevance
these findings to the toxicity of kraft bleachery
fluents is discussed. (Swichtenberg-IPC)

mathematical model of the organic components
a wetland ecosystem is developed and analyzed.
ne objective of the model is to be able to forecast
e effects of sewage wastewater disposal on the
osystem; this requires that the variables of water
d nutrients be included in the models of the
veral processes which may be affected by the
astewater disposal. Components of the ecosystem
e vascular plants, standing dead biomass, stem
d leaf litter, and soil. The model consists of a set
first-order, nonlinear differential equations rep-
senting the mass balance of the biomass compo-
nts of the system. Its analysis indicated the
odel's credibility as a first-time model that can be
ed as an aid in making decisions about the feasi-
ity of using a wetland ecosystem for wastewater
posal. (Steiner-Mass)

ndard (Sprague) static bioassay tests were used
determine the effects of temperature, salinity,
l their interaction on grass shrimp (Crangon
nciscorum) survival after 24 hr, 48 hr, 72 hr, and
hr exposure periods. All test organisms were collected from San Pablo Bay, California. Temperature and salinity had highly significant effects on survival and responses to changes in temperature and salinity were strongly interdependent. The optimal ranges of temperature and salinity for 90% survival at 96 hr were 14.5C to 17.0C and 18% to 20%. These values fall within the environmental fluctuations of the test organism's natural habitat. These results are in agreement with values reported for similar crustaceans. The interaction between effects of temperature and salinity appear to be an apparent inherent property of organisms. (Snyder-Calif, Davis)

FILTER-FEEDING ETHOLOGY OF BENTHIC INVERTEBRATES (ASCIDIANS). V. INFLUENCE OF TEMPERATURE ON PUMPING, FILTRATION, AND DIGESTION RATES AND RHYTHMS IN PHALLUSIA MAMILLATA,
Paris-6 Univ (France). Lab. Arago.
A. F. Medioni.
Marine Biology, Vol. 48, p 251-259, 1978. 4 fig, 5 tab, 17 ref.

Descriptors: *Water temperature, *Digestion, *Filtration, Benthic fauna, Invertebrates, Animal physiology, Animal metabolism, Seasonal, Currents(Water), Food habits, Animal behavior, *Ascidians, *Phallusia, Filter feeding, Invertebrates.

The influence of temperature has been studied simultaneously on the pumping, filtration, and digestion rates of Phallusia mammillata. Eighteen experiments were made between 7 and 25C on 5 individuals. As for pumping, maximum values were observed at 15C decreasing with lower and higher temperatures, such decreases being more marked at the higher temperatures. The filtering efficiency was fairly consistent throughout an experiment; the pumping and filtration curves were in fact almost parallel. The filtering efficiency of the branchial sac was high, with constant values at 10 and 15C; it became smaller at 20C, with a higher coefficient of variation. The digestion rate also displayed maximum values at 15C. It was lower at 10C and reached its minimum at 20C. The higher temperature affected the percentage of food utilization, which showed smaller values at 20C than at 10C and 15C. (EIS-Deal)

EFFECTS OF TURBIDITY AND SUSPENDED MATERIAL IN AQUATIC ENVIRONMENTS, LITERATURE REVIEW,
Wisconsin Univ., Stevens Point. Dept. of Biology; and Louisiana State Univ., Baton Rouge. Dept. of Zoology and Physiology.
E. M. Stern, and W. B. Stickle.
Available from the National Technical Information Service, Springfield, VA 22161 as ADA-056 035, Price codes: A06 in paper copy, A01 in microfiche. Army Engineer Waterways Experiment Station, Vicksburg, Miss. Technical Report D-78-21, June 1978. 118 p, 3 tab.

Descriptors: *Turbidity, *Suspended solids, *Suspended load, *Aquatic environment, *Environmental effects, *Bibliographies, *Reviews, *Dredged material disposal.

Literature review of the effects of turbidity and suspended material in aquatic environmentas covering: definitions, units of measure, and methods of measurement; origins; and effects in aquatic environments. Turbidity, regardless of the multiplicity of definitions, units of measure, and methods of measurement, is an expression of the optical properties of water that cause light to be scattered and absorbed rather than transmitted in a straight line. Turbidity is not the same as silation, although the terms have been used synonymously in the past. The literature indicates that turbidity and suspended solids conditions typically created by most dredging and disposal operations are of short duration and are unlikely to produce severe and irreversible ecological effects: possible exceptions to this generalization are coral reefs and other communities especially sensitive to turbidity. Any possible effects of turbidity and suspended material in aquatic environments may be further minimized by careful selection of disposal sites; keying operations to seasonal cycles in biological activity; and special consideration of areas that serve as nursery grounds. A COMPARISON OF PLANT SUCCESSION AND BIRD UTILIZATION ON DIKED AND UNDIKED DREDGED MATERIAL ISLANDS IN NORTH CAROLINA ESTUARIES,
North Carolina Univ. at Wilmington. Dept. of Biology.
J. F. Parnell, D. M. DuMond, and R. N. Needham.
Available from the National Technical Information Service, Springfield, VA 22161 as ADA-056 000, Price codes: A09 in paper copy, A01 in microfiche. Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, Technical Report D-78-9, May 1978. 286 p, 4 append, 57 tab, 32 fig, 58 ref. Also designated as University of North Carolina at Wilmington Contribution in Marine Sciences no. 797.

Descriptors: *Birds, *Estuaries, *Islands, *Plant populations, *North Carolina, *Succession, *Dredged material, *Waste disposal sites.

Compares plant succession and bird utilization on diked and undiked dredged material islands in North Carolina estuaries. After a site is diked, deposition of dredged material may be delayed for several years or it may occur immediately. Unfilled diked islands that were studied had a complex topographic zonation. Plant succession was highly variable on these unfilled sites, with topography, substrate particle size, and availability of water being major causative factors. Plant succession on diked and filled sites was similar to that on undiked islands except that dikes tended to vegetate more quickly than did the deposits on outer portions of undiked sites. Only the least and gull-billed terns were found nesting predominantly on diked sites, with most nesting gulls and terns locating the majority of their breeding colonies on undiked sites. Habitat diversity is expected to decrease on mature diked islands as such sites continue to receive dredged material. Such mature islands will likely not be as suitable for nesting colonial birds as either undiked or young diked islands. It is recommended that diking not be used on islands heavily used by nesting waterbirds or wading birds. (WES)

LEAD ACCUMULATION RATES IN TISSUES OF THE ESTUARINE TELEOST FISH, GILLICHTHYS MIRABILIS: SALINITY AND TEMPERATURE EFFECTS,
Scripps Inst. of Oceanography, La Jolla, CA.
G. N. Somero, T. J. Chow, P. H. Yancey, and C. B. Snyder.
Archives of Environmental Contamination & Toxicology, Vol. 6, No. 2/3, 1977, p 337-348, 2 fig, 4 tab, 24 ref.

Descriptors: Environmental effects, *Water pollution effects, *Temperature, *Salinity, *Lead, Fish, Estuaries, *Teleosts.

The four environmental variables considered in this work were sea water lead concentration, duration of exposure to lead, salinity, and temperature. Spleen, gills, fins, and intestine were found to accumulate the greatest amounts of lead with liver and muscle accumulating the least. Lead accumulation rate was dependent on both salinity and temperature with fish held at high temperatures accumulating more lead than those held at low temperatures and accumulation rate being inversely proportional to salinity. Decay of lead was observed in tissues possessing a covering of mucus. It was suggested that this was due to a complexing of the lead with mucus and subsequently being lost as the mucus sloughed off. Lead levels continued to rise in fish returned to natural seawater from lead-spiked seawater. (Chilton-ORNL)

TEMPERATURE REQUIREMENTS OF TILAPIA ZILLII,
California Univ., Riverside. Div. of Biological Control.
W. J. Hauser.
California Fish and Game, Vol. 63, No. 4, October 1977, p 228-233, 2 tab, 13 ref.

Descriptors: Environmental effects, *Water pollution effects, *Thermal pollution, *Temperature, Mortality, Biocontrol, *Cichlids, California, Laboratory tests, On-site investigations, Irrigation canals, Resistance, *Tilapia zillii.

Temperature requirements of the African cichlid, Tilapia zillii which is used for biological control of aquatic weeds were determined through laboratory experiments and field observations. Optimum temperature for feeding, growth and spawning was found to be between 20 and 32C. Water temperatures above 39.5C and below 11.2C resulted in deaths with extreme upper and lower lethal temperature tolerance limits being 42.5C and 6.5C. Field observations showed that survival was lessened with two-week exposures to 13.0C. It was concluded that these temperature requirements lessened the usefulness of the organism as a biological control agent in irrigation canals of southern California. (Chilton-ORNL)

FEEDING AND GROWTH RATES OF POLINICES DUPLICATUS PREYING ON MYA ARENARIA AT BARNSTABLE HARBOR, MASSACHUSETTS,
Massachusetts Univ., Amherst. Dept. of Zoology.
D. C. Edwards, and J. D. Heubner.
Ecology, Vol. 58, No. 6, Autumn 1977, p 1218-1236, 11 fig, 5 tab, 89 ref. NSF-U.R.P. GY7297.

Descriptors: Environmental effects, Temperature, *Feeding rates, *Growth rates, *Snails, *Predation, *Clams, *Massachusetts, *Barnstable Harbor(Mass).

Field observation showed that the major factors affecting feeding rates of the snail Polinices duplicatus eating the clam Mya arenaria were food supply, temperature, and predator size. Food supply studies showed that snails of each size ate similar numbers of prey/time when provided with excess prey of differing sizes. Temperature studies showed that feeding peaked at 0.6 Mya/snail/day in warm months and dropped to zero for 4 months in cold months. Larger predators consistently ate larger prey than did smaller ones with 4th-yr. snails ingesting 385 kilojoules/yr and 2nd-yr snails ingesting approximately 218 kJ/yr. Growth rates were correlated more with a snails age than its size. 2nd-yr snails grew nearly 3-fold in diameter while 4th-yr snails grew only 1.2-fold. (Chilton-ORNL)

TOXICITY OF INTERMITTENT CHLORINATION TO FRESHWATER FISH: INFLUENCE OF TEMPERATURE AND CHLORINE FORM,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Biology.
A. G. Heath.
Hydrobiologia, Vol 56, No 1, 1977, p 39-47, 7 fig, 6 tab, 19 ref.

Descriptors: Environmental effects, *Chlorination, *Temperature, *Water pollution effects, Thermal pollution, Fish, *Toxicity, Freshwater, Rainbow trout, Salmon, Carp, Shiners, Channel catfish, *Chlorine.

Bioassay results showed that temperature has relatively little effect on the lethal concentrations of either free chlorine or monochloramine to Salmo gairdneri, Oncorhynchus kisutch, Notemigonus crysoleucas, Cyprinus carpio and Ictalurus punctatus when the exposure is delivered intermittently. This conclusion should not necessarily be extended to conditions where a constant chlorine concentration is used. A greater toxicity to free chlorine compared to monochloramine was found. S. gairdneri, O. kisutch, and I. punctatus were the most sensitive to both types of chlorine with C. carpio bein most resistant and N. crysoleucas being intermediate in sensitivity. (Chilton-ORNL)

Transactions of the American Fisheries Society, Vol 107, No 2, March 1978, p 316-320, 5 fig, 1 tab, 22 ref.

Descriptors: Environmental effects, *Water pollution effects, Population, Density, Aquatic populations, *Phytoplankton, *Copper sulfate, Toxicity, *Simazine.

Phytoplankton density as estimated from chlorophyll a concentrations and total counts of phytoplankton was initially lower in ponds treated with copper sulfate than in control ponds but steadily increased over a three month period to a point where density was comparable in control ponds and ponds treated with copper sulfate. Phytoplankton density was greatly depressed in ponds treated with simazine but simazine applications over an extended period resulted in low dissolved oxygen concentrations which caused decreased fish yields and poor conversion ratios. Fish yield and conversion ratios were not affected by copper sulfate treatment. (Chilton-ORNL)

CHARACTERIZATION AND REUSE OF ASH POND EFFLUENTS IN COAL-FIRED POWER PLANTS,
Tennessee Valley Authority, Chattanooga.
T. Y. J. Chu, R. J. Ruane, and P. A. Krenkel.
Journal of the Water Pollution Control Federation, Vol 50, No 11, November 1978, p 2494-2508, 13 fig, 5 tab, 16 ref.

Descriptors: *Water pollution effects, *Powerplants, Effluents, Fly ash, Water quality, Ponds, Settling basins.

Characteristics of ash sluicing water were found to vary. The main factors affecting the variation were the source of the coal, method of firing, quantity and quality of sluicing water, efficiency of fly ash collecting methods, and performance of the settling ponds. The pH pond discharges was primarily influenced by calcium and sulfate concentrations in effluents from pulverized coal plants, method or firing and buffering capacity of raw water used for sluicing. Concentrations of suspended solids in the discharges appeared to be influenced by cenospheres. Twelve schemes for reuse of ash pond effluents were presented- four or these (complete reuse of bottom ash sluicing water, reuse of combined ash sluicing water for make-up wate in SO2 scrubbers, complete reuse of both botto and fly ash sluicing waters, and recycling of con bined ash sluicing water with treatment of blow down prior to discharge to a stream) in detail. Us of mathematical models was employed in the stu ies to represent the water balance applicable to th twelve combinations of schemes. (Chilton-ORNL

ZOOBENTHOS IN THERMAL DISCHARG TO WESTERN LAKE ERIE,
Michigan State Univ., East Lansing.
R. A. Cole, and J. E. Kelly.
Journal of the Water Pollution Control Federatio Vol 50, No 11, November 1978, p 2509-2521, fig, 4 tab, 30 ref.

Descriptors: Environmental effects, *Water poll tion effects, *Thermal pollution, *Benthos, *Zo plankton, *Cooling water, Discharge(Water), La Erie.

This 5 year study of benthic macroinvertebrates and near a once through cooling system include sampling of zoobenthos, oxygen concentratio temperature, sedimentary particle size, carbon a nitrogen. Zoobenthos were primarily tubificids a chironomids. Benthic abundance and sedimenta nitrogen and carbon were positively correlate with the percentage of silt and clay in the sed ment. Abundance, diversity and mean individu size of benthos declined in the discharge canal a an adjacent heated area. This decline in abundan and diversity were related to intense fish use of t thermal discharge. Increased abundance and mea size in the river appeared to be response to chang in water quality resulting from pumping of w oxygenated lake water through the degraded riv channel. (Chilton-ORNL)

POWER PLANT COOLING WATER CHLOR INATION IN NORTHERN CALIFORNIA,
California Univ., Berkeley.
S. J. Hergott, D. Jenkins, and J. F. Thomas.
Journal of the Water Pollution Control Federatio Vol 50, No 11, November 1978, p 2590-2601, fig, 3 tab, 16 ref.

Descriptors: *Water pollution effects, *Powe plants, *Chlorination, *Cooling water, *Californ Chlorine.

Chlorination frequency varied among five pow plants in Northern California from one per week four per day and duration of chlorination from 40 minutes per cycle. Oxidant residual determin at condenser inlets was the criterion used to dete mine chlorine dose level. As a result of mo precise measurements of residuals throughout t system, the chlorine dose was reduced to produ a residual of 0.5 mg C12/l at the condenser inle Results of in-plant studies and of decay and recei ing water studies at each of the five power plan (Contra Costa, Pittsburg, Potrero, Hunters Poi and Moss Landing) are detailed. SEASONAL DYNAMICS OF CU2+, ZN2+ CA2+, AND MG2+ IN GONADS AND LIVE OF WINTER FLOUNDER (PSEUDOPLEU ONECTES AMERICANUS): EVIDENCE FO SUMMER STORAGE OF ZN FOR WINTE GONAD DEVELOPMENT IN FEMALES,
Memorial Univ. of Newfoundland, St. John Marine Science Research Lab.
G. L. Fletcher, and M. J. King.
Canadian Journal of Zoology, Vol 56, No 2, Fe ruary 1978, p 284-290, 3 fig, 1 tab, 24 ref.

Descriptors: Environmental effects, *Season Copper, Zinc, Calcium, Magnesium, Fish, Repr duction, Water pollution effects.

Feeding activity in flounder occurred from Ap through October during each year of the stu (1972-1976). Measurement of metals deposited the gonads indicated that substantially more Z

Cu, and Ca are deposited in the ovaries than in the testes and more Mg accumulated in the testes. Male gonads increased to approximately 16% of body weight in November and then declined to 10% of body weight by January. Ovaries increased to approximately 16% of body weight by February. Ovulation and spawning occurred in June. Ovaries continued to incorporate all four metals after the fish had stopped feeding. It was concluded that Zn and Cu requirements could have been released from the liver or other storage areas within the fish and that Cu, Ca, and Mg could have been absorbed from seawater. EFFECT OF ENVIRONMENTAL TEMPERATURE ON BIOSYNTHESIS OF LIVER PHOSPHATIDYL-CHOLINE IN THE TROUT (SALMO GAIRDNERII),
Lyon-1 Univ., Villeurbanne (France). Lab. de Physiologie Generale et Comparee.
G. Zwingelstein, N. A. Malak, and G. Brichon.
Journal of Thermal Biology, Vol 3, 1978, p 229-233, 4 tab, 27 ref.

Descriptors: Environmental effects, *Thermal pollution, Fish, *Trout, Lipids, Temperature, Biochemistry, *Water pollution effects.

The data demonstrate that the alteration in fatty acid composition of trout liver phosphatidyl-choline in response to environmental temperature reflects the differences in molecular species biosynthesis. Incorporation of P32 was found to take place more rapidly in the molecular species with high degree of unsaturation. Trout acclimated to 11 and 21C showed that temperature acclimation did not change the relative proportions of label shown in the five subfractions. Incorporation of C14-methyl-choline also took place more rapidly in unsaturated molecular species but it was found that increases in incubation temperature resulted in a decrease in the proportion of label in the unsaturated fractions. TEMPERATURE ADAPTATION IN THE FRESHWATER SNAIL, HELISOMA TRIVOLVIS (SAY),, IN AN ARTIFICIALLY HEATED RESERVOIR IN THE SOUTHEASTERN UNITED STATES,
Savannah River Ecology Lab., Aiken, SC.
D. H. Wood.
Journal of Thermal Biology, Vol 3, 1978, p 187-194, 7 fig, 2 tab, 18 ref.

Descriptors: Environmental effects, *Water pollution effects, *Thermal pollution, *Snails, Temperature, Growth rates, Reproduction, Respiration, *South Carolina, Southeast US, Reservoirs.

Snails from an unheated area and from an area heated to 5C above normal by discharges from a nuclear production reactor were compared. Variation in metabolic-temperature responses was observed between animals from heated and unheated areas as well as between summer and winter generations. Snails from both areas produced three annual generations and spawning was synchronous except for a shorter mid-summer spawn in the heated area. Seasonal patterns of change in growth rates and in body weight relative to shell size were similar in the two areas. It was concluded that metabolic compensation is accompanied by homeostasis in other rate functions and can serve as indicators of present thermal adaptability but that they cannot give a complete indication of longterm adaptability because such patterns may change over an intermediate time span. (Chilton-ORNL)

OLISTHODISCUS LUTEUS (CHRYSOPHYCEAE) I. EFFECTS OF SALINITY AND TEMPERATURE ON GROWTH, MORTILITY AND SURVIVAL,
Rhode Island Univ., Kingston. Graduate School of Oceanography.
C. R. Tomas.
Journal of Phycology. Vol 14, No 3, September 1978, p 309-313, 5 fig, 1 tab, 31 ref.

Descriptors: Environmental effects, *Temperature, *Salinity, Phytoplankton, *Mortality, *Growth rates, Water pollution effects.

At a salinity range of 2-50%, O. luteus showed an increased tolerance to low salinities at higher temperatures. Growth response at low salinities and higher temperatures showed that sizable populations could be attained at 5%. At 5-50% salinity, variable but distinct optima for density, growth and motility were seen at 5, 10 and 30C. At lower salinities and temperatures, loss of mortality occurred. Loss of motility accompanied by low division rates appears to be partially responsible for reduced abundance under these environmental conditions. (Chilton-ORNL)
W79-01682

THE EFFECT OF TEMPERATURE AND BODY SIZE ON ELECTRON TRANSPORT SYSTEM ACTIVITY IN FRESHWATER ZOOPLANKTON,
Canada Centre for Inland Waters, Burlington (Ontario); and National Oceanic and Atmospheric Administration, Ann Arbor, MI. Great Lakes Environmental Research Lab.
U. Borgmann.
Canadian Journal of Zoology, Vol 56, 1978, 634-642, 3 fig, 6 tab, 25 ref.

Descriptors: Environmental effects, *Seasonal, *Temperature, *Zooplankton, Freshwater, Oxidation, Reduction(Chemical), Size, Water pollution effects.

The rate of cytochrome c reduction by NADH, succinate, and NADPH in Mysis relicta, Limnocalanus macrurus, and surface zooplankton was measured as a means of determining electron transport system activity. No seasonal variation in reaction rates was observed for Mysis of Limnocalanus but activity in surface zooplankton was significantly higher for NADH and succinate oxidation in samples collected between March and May when surface temperatures ranged from 1.3 to 9.6C than in samples collected when surface temperatures were 22-24C. Larger organisms were found to have lower activity per unit weight than did smaller organisms. It was suggested that, since the effects of temperature and size are similar for NADPH oxidation and NADH or succinate oxidation, the ratio of NADPH to either NADH or succinate oxidation might be a useful indicator of exposure to toxic organic compounds. (Chilton-ORNL)

THE EFFECTS OF SHORT AND LONG TERM TEMPERATURE STRESS ON SEROTONIN, DOPAMINE AND NOREPINEPHRINE CONCENTRATIONS IN MOLLUSCAN GANGLIA,
East Coast Neuroscience Foundation, Inc., New York.
G. B. Stefano, L. Hiripi, and E. J. Catapane.
Journal of Thermal Biology, Vol. 3, 1978, p 79-83, 2 fig, 32 ref.

Descriptors: Environmental effects, *Thermal pollution, Seasonal, Temperature, *Mollusks, *Thermal stress, Water pollution effects, *Monoamines, Central nervous system.

Serotonin, dopamine and norepinephrine concentrations of the central nervous system were determined on groups of Mytilus edulis and Anodonta cygnea which had been acclimated to either cold (5C) or warm (17 or 20C) temperatures and then subjected to temperatures of 5, 17 or 20, 28C. Monamine metabolism was shown to be modified during temperature acclimation in both bivalves. Cold stress significantly reducedserotonin levels in both organisms over a long term period. As a result of cold stress dopamine significantly increased after 12 h and remained elevated in both organisms. As a result of warm stress dopamine levels rose in M. edulis only at the 10 day reading. Norepine-phrine levels increased over the short term period in both organisms as a response to both cold and heat stress. (Chilton-ORNL)

THE INFLUENCE OF CONSTANT AND CYCLIC ACCLIMATION TEMPERATURES ON THE METABOLIC RATES OF PANOPEUS HERBSTII AND UCA PUGILATOR,
South Carolina Univ., Columbia. Belle W. Baruch Inst. for Marine Biology and Coastal Research.
R. F. Dame, and F. J. Vernberg.
Biological Bulletin, Vol. 154, April 1978, p 188-197, 4 fig, 3 tab, 21 ref. NSF GA-36915.

Descriptors: *Environmental effects, *Temperature, *Crabs, Energy budget, Respiration, *Metabolism, Cycles, Water pollution effects, Cyclic temperatures, Constant temperatures.

Experimental data showed that the metabolic rate of the organisms studied was influenced differently by constant and cyclic temperature acclimation regimes. In Panopeus the most significant difference occurred in the 15-25C cycle. Crabs exposed to this cycle had a lower metabolic rate than animals exposed to a constant temperature of 25C. Respiratory responses of Uca to increasing cyclic temperature acclimation time were different than those of Panopeus and were highly variable. It was suggested that these organisms utilize energy more efficiently when subjected to natural cyclic temperature conditions than when subjected to constant temperature environments and that this difference in metabolic data would be significant in analyzing the role of yearly energy budgets in ecosystem energetics. VERTEBRAL VARIATION IN ZEBRAFISH (BRACHYDANIO RERIO) RELATED TO THE PREFERTILIZATION TEMPERATURE HISTORY OF THEIR PARENTS,
Manitoba Univ., Winnpeg. Dept. of Zoology.
W. Dentry, and C. C. Lindsey.
Canadian Journal of Zoology, Vol 56, 1978. p 280-283, 1 fig, 9 ref.

Descriptors: Environmental effects, *Thermal pollution, Temperature, Fish, Reproduction, Breeding, Fish genetics, Water pollution effects, *Zebrafish, Parental temperature history, Vertebral count.

Experimental results indicated that in offspring reared at the same temperature and produced by the same parents, vertebral counts differed depending upon the temperature at which the parents were being held at the time of laying. In all cases where differences between pairs were significant, vertebral count was higher in the sample originating from the higher parental holding temperature. It was concluded that even though interpretation of these results is complicated by differences among thermal responses of different breeding pairs, the existence of a parental temperature history effect on offspring vertebrae is strongly indicated and that such an effect should be looked for in other species of fish. SOME EFFECTS OF PHOTOPERIOD, TEMPERATURE, AND FOOD ON EMERGENCE IN THREE SPECIES OF CHIRONOMIDAE (DIPTERA),
Brock Univ., St. Catherines (Ontario). Dept. of Biological Sciences.
H. V. Danks.
The Canadian Entomologist, Vol 10, No 3, March 1978, p 289-300, 6 fig, 3 tab, 30 ref.

Descriptors: Environmental effects, *Temperature, *Diptera, Larvae, *Photoperiodism, *Food abundance, Water pollution effects.

Newly hatched larvae of Chironomus decorus, Endochironomus nigricans, and Chironomus staegeri were reared to adulthood at 15 and 20C and 16 and 8 h daily photoperiods. C. decorus required 26 days at 20C and 37 days at 15C for normal development to EM50; E. nigricans required 35 days at

20C and 48 days at 15C; and C. staegeri required 68 days at 20C. Emergence was inhibited in 8 h daily photoperiods at both temperatures for E. nigricans and C. staegeri and at 15C for C. decorus. Some few individuals emerged even under these adverse conditions. It was suggested that small percentages of atypical individuals might buffer populations in years of unusual environmental conditions. Moderate reduction of food did not appear to greatly alter the initial emergence pattern compared with fully fed chambers, but it did delay the development of some individuals and increased mortality. CONTROLLED ECOSYSTEM POLLUTION EXPERIMENT: EFFECT OF MERCURY ON ENCLOSED WATER COLUMNS. VIII. SUMMARY OF RESULTS,
Woods Hole Oceanographic Inst., MA.
G. D. Grice, and D. W. Menzel.
Marine Science Communications, Vol. 4, No. 1, 1978, p 23-31, 10 ref.

Descriptors: Environmental effects, *Water pollution effects, *Mercury, Bacteria, Plankton, Fish, Copepods, Sediments, Bioassay, Ecosystems.

This paper summarizes the results of previously reported experiments on the reactions to mercury of plankton communities maintained in 1300 cubic meter plastic enclosures for a period of 72 days. A significant decrease in bacterial biomass occurred within one day after addition of mercury followed by a recovery to control levels within 7 days. A similar reduction and recovery was seen in counts of viable colonies of bacteria. Phytoplankton productivity decreased for a period of 12 days following mercury addition. Naupliar copepods were significantly reduced in abundance and showed little signs of recovery for 34 days. Growth of chum salmon was reduced. This appeared to be related to decreased food supply rather than direct effect of mercury. Total mercury concentration in solution and suspension decreased at a rate of about 3%/day during the time of the experiment. 90% was recovered in sediment at the close of the experiment. BACTERIAL AEROSOLS FROM COOLING TOWERS,
Army Dugway Proving Ground, UT.
A. P. Adams, M. Garbett, and B. G. Lewis.
Journal Water Pollution Control Federation, Vol 50, No 10, 1978, p 2362-2369, 4 tab, 30 ref.

Descriptors: Environmental effects, *Water pollution sources, *Air pollution effects, Powerplants, *Cooling water, *Bacteria, Chlorination, *Aerosols.

The Burbank, California municipal electrical generating plant, which uses wastewater effluent for makeup water, was chosen for this study. Samples were taken for analysis at a six month interval. During this time the method of chlorination was switched from gaseous chlorine to chlorine dioxide. Total bacteria counts in the water of the cooling-tower basin differed by a 1000-fold reduction after the use of chlorine dioxide was introduced. A drastic reduction also occurred in the count of the viable bacteria-bearing particles exiting into the air via the cooling-tower vents. It was concluded that the aerosol count of bacterial particles expelled from the cooling tower would offer no significant cause for concern for people downwind of the cooling tower. (Chilton-ORNL)

EFFECTS OF CHLORINATION ON DIFFERENTIATED COLIFORM GROUPS,
Tufts Univ., Medford, MA.
E. C. Kinney, D. W. Drummond, and N. B. Hanes.
Journal Water Pollution Control Federation, Vol. 50, No. 10, 1978, p 2307-2312, 2 fig, 6 tab, 15 ref. Pub. Health 3A04AH 00717-0151.

Descriptors: Environmental effects, *Water pollution effects, *Chlorination, *Bacteria, *Coliforms, Animal growth.

The purpose of this study was to investigate the phenomenon of apparent regrowth of three major coliforma subgroups (Escherichia coli, Klebsiella spp., and Enterobacter-Citrobacter spp.) in a chlorinated wastewater effluent. It was suggested that the mechanism causing the increasing bacterial numbers after chlorination is recovery of damaged cells rathen than growth of surviving cells. It was concluded that the bacterial behavior observed raises doubts about the need for chlorination of a well-treated effluent in which bacterial death occurs without disinfection. Results also suggest that a delayed bacterial analysis of stored samples should be used for the evaluation of the efficiency of the chlorination procedure. (Chilton-ORNL)

UPTAKE OF ZINC BY THE AQUATIC LARVAE OF SIMULIUM ORNATIPES (DIPTERA: NEMATOCERA),
Australian National Univ., Canberra. Dept. of Zoology.
J. G. T. Carter, and W. L. Nicholas.
Australian Journal of Marine and Freshwater Research, Vol. 29, No. 3, June 1978. p 299-309, 3 fig, 4 tab, 16 ref.

Descriptors: *Environmental effects, *Water pollution effects, *Metals, *Zinc, *Diptera, *Absorption, Toxicity, Larvae.

Experimental results showed that S. ornatipes larvae exposed to zinc absorb appreciable amounts of the metal. An increase in calcium ion concentration reduced the toxicity of zinc to the larvae but had no effect on the uptake from high or low concentrations or on the loss of zinc. Fractionation of larvae into cuticle, high- and low-molecular-weight fractions showed that in the cuticle and high-molecular-weight fractions two pools may be identified. In one pool, zinc is weakly held and exchanges rapidly with the zinc in solution. In the other, zinc is held and exchanges slowly. The quantity of zinc entering these pools was influenced by exposure time, temperature and concentration. Data indicated that zinc was bound by phenolic groups in the cuticle fraction and by phosphonic acids in the high-molecular-weight fraction. (Chilton-ORNL).

THE PHOSPHORUS STATUS OF THE SEDIMENTS OF THREE EUTROPHIC LAKES IN VICTORIA,
La Trobe Univ., Bundoora (Victoria). Dept. of Inorganic and Analytical Chemistry.
S. J. E. Slater, and A. J. Boag.
Australian Journal of Marine and Freshwater Research, Vol 29, No 3, June 1978, p 263-274, 2 fig, 4 tab, 23 ref.

Descriptors: Environmental effects, *Water pollution effects, Sedimentation, *Phosphorus, *Lake sediments, *Victoria, Lakes, *Australia.

Sediments from Lakes Burrumbeet, Learmonth, and Colac in Victoria were analyzed for phosphorus, iron, and aluminum. Lake Colac contained the highest levels of all forms of sediment phosphorus (Total P - 378-527 mg/kg, Inorganic P - 353-418 mg/kg, Organic P - 11-173 mg/kg) as well as the greatest potential for the release of dissolved reactive phosphorus to the overlying water. Correlations between the sediment parameters amorphous iron and inorganic phosphorus which have been reported for other lakes were not found to be applicable to the data gathered in this study. (Chilton-ORNL)

STUDIES ON THE MYTILUS EDULIS COMMUNITY IN ALAMITOS BAY, CALIFORNIA. VII. THE INFLUENCE OF WATER-SOLUBLE PETROLEUM HYDROCARBONS ON BYSSAL THREAD FORMATION,
California State Univ., Long Beach. Dept. of Biology.
R. S. Carr, and D. J. Reish.
The Veliger, Vol 21, No 2, October 1978, p 283-287, 3 tab, 14 ref.

Descriptors: Environmental effects, *Water pollution effects, Oil pollution, *Mussels, Organic compounds, *Oil wastes, *California, *Alamitos Bay(Calif).

Mytilus edulis ranging in width from 18 to 23 mm were exposed to varying concentrations (25, 50, 75, and 100%) of the water-soluble fraction (WSF) of No. 2 fuel oil, South Louisiana crude oil and Sta-lube outboard motor oil. Byssal thread production was significantly inhibited at the 100% level for all three oils. South Louisiana crude oil showed the greatest inhibitory influence on a percent WSF basis and Sta-lube the least effect. Significant enhancement of byssal thread formation was observed for all three WSFs at concentrations lower than those at which an inhibitory effect was produced. (Chilton-ORNL)

MORPHOLOGICAL VARIATION OF ELODEA IN WESTERN MASSACHUSETTS: FIELD AND LABORATORY STUDIES,
Smith Coll., Northampton, MA. Dept. of Biological Sciences.

D. K. Lawrence.
Rhodora, Vol. 78, No. 816, p 739-749, December 1976. 3 tab, 21 ref. OWRT A-042-MASS(3), 14-31-0001-5021.

Descriptors: *Aquatic weeds, *Bioindicators, *Plant morphology, Aquatic plants, Eutrophication, *Massachusetts, Elodea canadensis, Elodea nuttallii.

Elodea canadensis and E. nuttallii have a potential use as indicators of pollution and are economically important plants because of their occurrence as troublesome waterweeds. Due to infrequent and brief flowering periods, leaf morphology (and particularly leaf width) is often used to differentiate these species. A tank experiment was designed to test the effects of elevated temperatures, comparable to those attained in some field situations, on the vegetative morphology of typical E. canadensis. Leaf width was reduced at higher temperatures and leaves were produced which fell within the reported range of E. nuttallii. Accepted taxonomic criteria for distinguishing E. canadensis and E. nuttallii are not satisfactory in determining four of 10 naturally occurring populations sampled in western Massachusetts. (Godfrey-Mass)

THE SPREAD OF SEVERAL INTRODUCED OR RECENTLY INVADING AQUATIC IN WESTERN MASSACHUSETTS,
Smith Coll., Northampton, MA. Dept. of Biological Sciences.
C. J. Burk, S. D. Lauermann, and A. L. Mesrobian.
Rhodora, Vol. 78, No. 816, p 727-767, December 1976 17 ref. OWRT A-042-MASS(4), 14-31-0001-5021.

Descriptors: *Aquatic plants, *Aquatic weeds, Eutrophication, Water pollution effects, Marsilea quadrifolia L. Wolffia columbiana(Karst), Trapa natans L., Cabomba carolininana(Gray), *Massachusetts.

Changes in the distributional status of several recently introduced or invading vascular plant species have been observed during the present century. Water colver, Marsilea quadrifolia L. has become established since 1945 along two miles of the Mill River in Northampton, Massachusetts, and successfully invaded the Arcadia Wildlife Sanctury marsh during a period of disturbance. Watermeal, Wolffia columbiana (Karst) unknown in the area prior to 1933, is now abundant in highly eutrophic lakes and impoundments which receive sewage effluents. Water chestnut, Trapa natans L. has reached pest densities in Upper and Lower Ponds on the Mount Holyoke College campus in South Hadley and has escaped to form a colony downstream in Stoney Brook. Cooter-grass, Cabomba caroliniana (Gray), first detected in Massachusetts in 1930, has spread to several other western Massachusetts sites and is the dominant submerged aquatic plant life in Lake Rohunta in Franklin and Worcester Counties. Each of these species occurs in sites affected by some form of habitat disruption; none is yet so widespread as to be regularly encountered in freshwater systems. (Lefferts-Mass)

GENETIC DAMAGE TO A FERN POPULATION GROWING IN A POLLUTED ENVIRONMENT: SEGREGATION AND DESCRIPTION OF GAMETOPHYTE MUTANTS,
Massachusetts Univ., Amherst. Dept. of Botany.
E. J. Klekowski, Jr., and E. L. Davis.
Canadian Journal of Botany, Vol. 55, No. 5, p 542-548, 1977, 6 fig, 2 tab, 14 ref. OWRT B-053-MASSZ(3), 14-34-0001-6087.

Descriptors: *Ferns, *Genetics, Water pollution effects, Plant populations, *Riparian plants, Rivers, *Massachusetts, *Osmunda regalis, *Mutants, *Millers River(Mass).

A population of the fern Osmunda regais growing in a polluted river was investigated genetically. Previous studies documented a high frequency of postzygotically induced genetic and chromosome damage. This paper describes two categories of gametophytic mutants which occurred in the progeny of this population. A gametophyte phenotype which exhibited a maternal effect on the sporophyte generation when it was the female parent occurred in 7.8% of the spore sample. A gametophyte phenotype which could best be characterized as a neuter calluslike mass occurred in 6.6% of the spore sample. Studies of nearby O. regalis populations in non-polluted sites failed to document the presence of such phenotypes in the spore samples. (Godfrey-Mass)

MICROFLORAL RESPONSE TO AQUATIC WEED DECOMPOSITION,
Massachussets Univ., Waltham. Dept. of Environmental Sciences.
J. Rho, and H. B. Gunner.
Water Research, Vol. 12, p 165-170, 1978. 5 fig, 3 tab, 21 ref. OWRT B-058-MASS(1), 14-34-0001-7161.

Descriptors: *Aquatic weeds, *Eutrophication, Microflora, *Aquatic algae, Nutrients, *Decomposing organic matter, Chlorophyta, *Nitrates, *Nitrites, *Phosphates, *Myriophyllum heterophyllum, *Water milfoil.

Microfloral response to the liberation of N and P from decomposing water milfoil tissue (Myriophyllum heterophyllum) was determined under various laboratory conditions. The death and decay of the macrophyte released ammonia and phosphate in concentrations sufficient to promote algal growth. The oxidation of ammonia by resident nitrifiers exercised a striking impact on microflora succession. Nitrification was accompanied by a decrease in pH and thereafter by a decline in the numbers of bacteria and protozoa. Subsequently, coincident with the accumulation of nitrite and nitrate, the numbers of the resident green algal communities rose dramatically. These results, coupled with field observations, indicate that nutrient released by decomposing aquatic weeds and the changes attendant upon nitrification are of significance in the distribution and abundance of aquatic microflora. Journal of Phycology, Vol. 14, No. 3, p 333-337, September 1978. 1 fig, 4 tab, 15 ref. OWRT A-099-MISS(3), 14-34-0001-7052.

Descriptors: *Cyanophyta, *Salt marshes, *Soil algae, *Biological communities, *Ecological distribution, Biogeography, Light intensity, Bulrush, *Mississippi, *Graveline Bay Marsh(Miss), Community structure, Schizothrix, Spartina, Juncus, Distichlis.

Edaphic bluegreen algal communities were sampled from five monotypic angiosperm zones in Graveline Bay Marsh near Ocean Springs, Mississippi. Samples and environmental data were taken quarterly from October 1976 to June 1977 beneath the following angiosperms: Distichlis spicata (L.) Greene, Scirpus olneyi Gray, Spartina patens (Aiton) Muhl., S. alterniflora Loisel., and Juncus roemerianus Scheele. Results showed that communities in all five zones of the marsh were dominated by Schizothrix calcicola (Ag.) Gom. throughout the year, while subdominants varied according to season. The number of individuals in all zones was greatest in the summer and lowest in the winter. An examination of the structure of the five edaphic communities indicated a single, nearly homogeneous community exists over the entire surface of the marsh shaded by an angiosperm canopy. Light intensity appears to be the major factor affecting the distribution of bluegreen algae in this salt marsh. The results of this study are in agreement with those conducted in other North Atlantic temperate salt marshes.

THE EFFECTS OF INTERMITTENT CHLORINATION ON COHO SALMON, ALEWIFE, SPOTTAIL SHINER, AND RAINBOW SMELT,
Wisconsin Univ., Milwaukee. Dept. of Zoology; and Wisconsin Univ., Milwaukee. Center for Great Lakes Studies.
G. L. Seegert, and A. S. Brooks.
Transactions of the American Fisheries Society, Vol. 107, No. 2, p 346-353, 1978. 4 tab, 20 ref.

Descriptors: *Freshwater fish, *Chlorination, *Shiners, *Smelts, Salmon, Mortality, Water temperature, Water quality, Environmental effects, Lethal limit, Resistance, Laboratory tests, Bioassay, *Coho salmon, *Alewife, Spottail shiner, Rainbow smelt.

Coho salmon, alewife, spottail shiner, and rainbow smelt were exposed for 30 min to residual chlorine. The alewifes were tested at 10, 15, 20, 25, and 30C, the salmon and shiners at 10, 15, and 20C and the smelt at 10C. Thirty minute LC50 values were both species and temperature dependent. All species showed an inverse relationship between test temperatures and LC50 values. Mortalities usually occurred within 24 h after exposure. Except for the 10-C spottail shiner, fish rarely recovered, following loss of equilibrium. Concentrations resulting in no mortality were 0.6-0.7 of the LC50 value. (EIS-Klein)

REPORT OF A WORKSHOP ON THE IMPACT OF THERMAL POWER PLANT COOLING SYSTEMS ON AQUATIC ENVIRONMENTS, VOL. I. WORKING GROUP RESULTS,
Sigma Research, Inc., Richland, WA.
R. Goldstein.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-252 760, Price codes: A07 in paper copy, A01 in microfiche. Report to Electric Power Research Institute, Palo Alto, California, April, 1976. 122 p, 2 tab, 10 fig.

Descriptors: *Thermal pollution, *Thermal power, *Thermal power plants, Thermal stress, Thermal water, *Water pollution effects, Ecology, Cooling water, Cooling towers, Water pollution sources, Aquatic environment, Aquatic habitats, *Entrainment, Chemical discharge, *Waste heat management, *Ecosystem characterization.

The Electric Power Research Institute (EPRI) sought to determine the current high-priority research needs which have broad application to defining aquatic power plant impacts. Through an advisory workshop on the Impact of Power Plant Cooling Systems on Aquatic Environments held at Pacific Grove, California, in late September, 1975. This workshop brought together about 30 highly knowledgeable scientists and engineers who were representatives of academia, government, industries, and consulting firms. Projects recommended: and include: (1) population, community, ecosystem effects of reduced survival or changes in distribution; (2) chemical/physical studies; (3) intake effects (near field); (4) ecosystem management; (5) entrainment damage; (6) ecosystem characterization; (7) discharge effects; (8) waste heat management; (9) standardization of methods; (10) information synthesis and evaluation; and (11) information center. Volume I includes the deliberations of the workshop and the research recommendations made. (EIS-Katz)

A BIOLOGICAL ASSESSMENT OF FISH AND BENTHIC POPULATIONS INHABITING A KRAFT MILL EFFLUENT CHANNEL,
Florida Univ., Gainesville. School of Forest Resources and Conservation.
R. B. Juul, and J. V. Shireman.
Water Research, Vol. 12, No. 9, p 691-701, 1978. 6 fig, 2 tab, 19 ref.

Descriptors: *Pulp wastes, *Aquatic life, Fish growth, *Waste water disposal, *Environmental effects, Effluents, Oxidation lagoons, Pulp and paper industry, Diptera, Benthic fauna, Aquatic productivity, Fish diets, Catfishes, Water pollution effects, Industrial wastes.

Studies were performed from June 1974 to September 1975 at the waste water treatment facility of the Hudson full bleach pulp mill near Palatka, Florida, to survey naturally-occurring fish and benthic populations within a kraft pulp mill effuent (channel). After treatment by a primary clarifier and a series of four oxidation ponds, the effluent is discharged through a cement riffleway into an 0.5-0.7 m deep earthen channel. Benthic organisms in the channel were dominated by chironomid larvae whose relative distribution and abundance varied with respect to the channel flow rate and substrate characteristics; concentrations were highest on clay bottom slopes within 1 m of shore. Dissolved oxygen, temperature, pH, flow rate, and BOD were also measured in the channel throughout the study period. A total of 25 species of fish were collected within the channel; some of these fish appeared to be permanent residents and others appeared seasonally, although spawning was never observed. Chironomid larvae were utilized as a food source by both brown bullheads and white catfish. Mosquitofish, the predominant foragers in the channel, were consumed along with coleopterans by larger fish. The growth rates of white catfish and warmouth in the effluent channel were at least comparable to that expected for natural waters. (Schulz-FIRL)

EFFECTS OF CRUDE OILS ON THE GROWTH OF ARCTIC MARINE PHYTOPLANKTON,
Fisheries and Marine Service, Ste. Anne de Bellevue (Quebec). Artic Biological Station.
S. I. C. Hsiao.
Environmental Pollution, Vol 17, No 2, p 93-107, October 1978. 7 fig, 1 tab, 23 ref.

Descriptors: *Phytoplankton, *Arctic, *Water pollution effects, *Oil pollution, Resources development, Cold regions, Environmental effects, *Oil wastes, *Outer Continental Shelf, *Crude oil, Oil spills, Species sensitivities, Differential growth.

Growth response of arctic marine phytoplankton to crude oils were determined at various temperatures and exposures in a defined medium at constant light energy. The growth of diatoms (Chaetoceros septentrionalis Oestrup, Navicula bahusiensis (Grunow in van Heurck) Grunow and Nitzchia delicatissima Cleve) was inhibited by Atkinson Point, Norman Wells, Pembina and Venezuela crude oils after ten days' exposure at a concentration of 10 ppm at 0C, 5C and 10C. Growth of the green flagellate Chlamydomonas pulsatilla Wohlenweber was stimulated by Norman Wells and Pembina crude oils at 0C. Growth of both diatoms and the green flagellate was markedly inhibited by oil concentrations higher than 100 ppm but diatoms were more severely impaired than the green flagellate. Greater inhibition generally occurred with longer exposure at temperatures between 5C and 10C than at 0C. Chlamydomonas was not killed by any of the crude oils at the concentrations, temperatures and lengths of exposure tested. Lethal effects among diatoms varied with species, types of oil, temperatures and exposure time. Relative species sensitivity of the phytoplankton to the oils was determined based on percentage survival, exponential growth rate and generation time. Chlamydomonas was the most tolerant species and had a greater ability to resume growth, while diatoms were sensitive and had little or no ability to resume growth. Possible ecological consequences of such species sensitivity and differential growth are discussed. (Sinha-OEIS)

TEXAS COASTAL MANAGEMENT PROGRAM ECOLOGICAL SYSTEMS COMPONENT, USER'S MANUAL.
Research and Planning Consultants, Inc., Austin, TX.
Texas General Land Office, (Austin), 15 September 1978. 143 p, 17 fig, 12 tab, 5 append.

Descriptors: *Environmental effects, *Resources development, *Ecology, *Texas, Water pollution effects, Coasts, Data processing, *Outer Continental Shelf, Manuals, Environmental impact.

The Ecological Systems Component (ESC) provides the mechanism for estimating environmental effects of development activities in the Texas Coastal region, though the methodology is not limited to coastal ecosystems. This User's Manual provides a natural scientist with step by step instructions for the documentation of an environmental assessment. It is supplemented by a variety of technical papers. The ESC is, in essence, a simple system of documenting the series of professional judgments which make up all environmental assessments. The length of an assessment using the ESC is determined by the complexity of the activity analyzed and the complexity of the ecosystems where the activity is to occur. The complex issue raised by the ESC is how the 'significance' or 'importance' of an impact on a biological system is to be defined and measured. While this manual makes suggestions on how the magnitude and probability of impacts can be defined, it leaves the definition of these terms to the professional judgment of scientists and policy-makers. MARINE BIOLOGICAL EFFECTS OF OCS PETROLEUM DEVELOPMENT,
National Oceanic and Atmospheric Administration, Boulder, CO. Outer Continental Shelf Environmental Assessment Program.
D. A. Wolfe.
NOAA Technical Memorandum ERL OCSEAP-1, September 1978. 332 p, numerous fig, tab, ref. NOAA-TM-OCSEAP-1.

Descriptors: *Water pollution effects, *Baseline studies, *Oil pollution, *Alaska, Research priorities, Reviews, *Outer Continental Shelf, Petroleum hydrocarbons, Biological effects.

This document contains the proceedings of the first formal scientific review of the Biological Effects Studies managed by NOAA's Outer Continental Shelf Environmental Assessment Program (OCSEAP). The review was conducted November 29-December 1, 1977 at the Northwest and Alaska Fisheries Center in Seattle, Washington. The projects, managed by NOAA/OCSEAP, fall into two categories, based on the sources of financial support: Bureau of Land Management Environmental Studies Program in support of OCS leasing for Alaskan oil and gas development (Part I of Proceedings); NOAA's Energy Resources Project on Fate and Effects of Petroleum Hydrocarbons in Marine Ecosystems and Organisms, which is part of the Federal Interagency Energy/Environment Program, funded through the Environmental Protection Agency (Part II of Proceedings). Part II of the Proceedings contains discussions of selected topics addressed at the Review and a brief synopsis of general comments received from the invited outside reviewers. (Author extracted)

OCSEAP: AN OVERVIEW AND A CONTEXT FOR STUDIES ON BIOLOGICAL EFFECTS,
National Oceanic and Atmospheric Administration, Boulder, CO. Environmental Research Labs.
D. A. Wolfe.
In: NOAA Technical Memorandum ERL OCSEAP-1, 'Marine Biological Effects of OCS Petroleum Development,' September 1978. p 1-10, 2 fig, 4 tab, 5 ref.

Descriptors: *Oil pollution, *Water pollution effects, *Baseline studies, Alaksa, *Outer Continental Shelf, Biological effects, Petroleum hydrocarbons.

The Bureau of Land Management (BLM) initiated an extensive marine environmental studies program in response to national needs to assess the potential effects of OCS oil and gas development and to protect the environment. Through the offices of the Outer Continental Shelf Environmental Assessment Program (OCSEAP), the National Oceanic and Atmospheric Administration is planning and conducting for BLM that portion of the environmental studies program applicable to the OCS of Alaska. For each lease area, OCSEAP has implemented a studies program designed to facilitate the assessment of potential OCS-related impacts. The studies program addresses six major tasks or questions, which together will enable BLM to proceed with OCS leasing, while minimizing the environmental risks of subsequent oil and gas development. ACUTE AND CHRONIC TOXICITY, UPTAKE AND DEPURATION, AND SUBLETHAL RESPONSE OF ALASKA MARINE ORGANISMS TO PETROLEUM HYDROCARBONS,
National Marine Fisheries Service, Auke Bay, AK. Auke Bay Lab.
S. D. Rice, J. F. Karinen, and S. Korn.
In: NOAA Technical Memorandum ERL OCSEAP-1, 'Marine Biological Effects of OCS Petroleum Development,' September 1978. p 11-24, 22 ref.

Descriptors: *Oil pollution, *Water pollution effects, *Toxicity, *Baseline studies, Fish, Shellfish, Alaska, *Outer Continental Shelf, Petroleum hydrocarbons, Crude oil, Fuel oil, Sublethal effects.

Oil effects studies at the Auke Bay Laboratory began in late 1971, however this report describes progress associated with OCSEAP funding which began in the last 2 months of FY 75, and draws primarily from published or drafted manuscripts. The studies can be broken down into two basic themes: (1) Toxicity challenge experiments, where an attempt is made to identify sensitive species, life stages, facotrs that affect toxicity, or components that are most responsible for toxicity; and (2) sublethal physiological response, where an attempt is made to identify, measure, and characterize physiological responses that are indicative of oil stress. Results from the series of sublethal effects studies may have application to monitoring effects of oil and defining the mode of action of toxicants. (See also W79-01788) (Sinha-OEIS)

significant body of evidence has been accumu-
ted to indicate that aromatic hydrocarbons are
pidly and progressively converted to metabolites
the pelagic and demersal fish and in invertebrate
rval forms. The literature on animal systems in
eneral affirms the concept that extremely low
vels of arene oxides are damaging to biological
stems in many ways, which includes their strong
utagenic and carcinogenic potential. The tenden-
of starry flunder to accumulate high propor-
ons of metabolites in skin is of interest with
spect to their known susceptibility to lesion for-
ation in this tissue. Evidence presented for the
le of mucus in the excretion of naphtahlene and
etabolites in fish suggests that such exudates must
considered along with other routes of elimina-
on which lead to the recycling of petroleum and
etabolic products in the marine environment.
he findings to day imply that the pelagic species
ay be less susceptible to accumulating aromatic
drocarbons from the environment than the de-
ersal species, although a wider variety of differ-
t organisms must be studied in each class to
rify this hypothesis. (See also W79-01788)(Sinha-

obtain the most comprehensive and in-depth
aluation of the impact of trace metals on arctic
d subarctic organisms, the investigation was car-
d out in three separate phases: (1) Biochemical
eractions of trace metals in fish which dealt with
tterns of uptake, accumulation, and retention of
d and cadmium in key tissues of fish exposed to
w levels of water-borne metals at 4 degree and
degrees C (Subcellular distribution of metals as
ll as mechanisms of excretion were also stud-
); (2) evaluation of importance of skin and epi-
rmal mucus in metabolism and excretion of
tals which defines uptake, accumulation and
scharge of trace metals from epidermal mucus,
n, and scales of fish; and (3) influence of metal
posure on hydrocarbon metabolism in fish. This
dy was initiated to assess alterations in the pro-
es of metabolites of hydrocarbons (e.g., naphtha-
ne) in tissues of fish exposed to lead and cadmi-
n. (See also W79-01788) (Sinha-OEIS)

cts, *Baseline studies, *Fish diseases, Alaska, Pa-
ology, *Outer Continental Shelf, Flatfish, Crude

ata from two separate studies are presented. One
dy concerns the long-term pathological effects
exposing flatfish to sediments contaminated with
askan crude oil, and the other deals with the
evalence, distribution, and pathology of disease
demersal fishes in the Bering Sea, Gulf of
aska, Norton Sound, and Chukchi Sea. The
thological effects of crude oil-contaminated sedi-
nts on flatfish were investigated by a multidisci-
plinary effort involving the fields of pathology, analytical chemistry, fishery biology, and electron microscopy. In addition to identifying the types of pathological conditions in Alaskan marine fish and their prevalence and geographical distribution, the baseline study included efforts to determine the cause(s) of these conditions. The principal contribution of these baseline studies has been the demonstration that significant frequencies of disease are presently in the demersal fish populations associated with Alaska's Outer Continental Shelf. The studies have also provided information concerning the species free of detectable disease and those species affected by specific diseases, the geographic distribution of affected fish, and the possible causes of some of the diseases. PHYSIOLOGICAL AND BEHAVIORAL EFFECTS,
National Marine Fisheries Service, Seattle, WA. Northwest and Alaska Fisheries Center.
H. O. Hodgins.
In: NOAA Technical Memorandum ERL OCSEAP-1, 'Marine Biological Effects of OCS Petroleum Development,' September 1978. p 72-86, 4 fig, 5 tab.

Descriptors: *Water pollution effects, *Oil pollution, *Baseline studies, *Physiology, Animal behavior, Salmonids, Alaska, Arctic, *Outer Continental Shelf, Petroleum hydrocarbons, Disease resistance, Oncorhynchus, Pandalus platyceros, Onchidoris, Salmo, North Pacific Ocean.

Physiological and behavioral studies were designed as laboratory experiments--with the notable exception of field studies of salmon homing--to evaluate effects of sublethal petroleum exposure on species indigenous to the North Pacific Ocean tested under natural water quality and temperature conditions. The studies have provided clear implications that in certain instances heavy exposures of fish to the petroleum have little effect on physiology; whereas, in other instances, severe effects may result from light to moderate exposures to petroleum. In the category of 'severe exposure--little effect' are the studies of oil in the diet on trout reproduction, and the disease resistance research with salmon and trout. In both of these studies high doses of crude oil in diets induced little or no detectable physiological impairment. Conversely, exposure of spot shrimp and dorid nudibranchs to ppb levels of petroleum in seawater resulted in potentially disastrous effects on feeding behavior, reproductive behavior, or embryogenesis. Other studies, such as effects of petroleum on salmon migration, may fall somewhere between the above two extremes. (See also W79-01788) (Sinha-OEIS)

MORPHOLOGY,
National Marine Fisheries Service, Seattle, WA. Northwest and Alaska Fisheries Center.
J. W. Hawkes.
In: NOAA Technical Memorandum ERL OCSEAP-1, 'Marine Biological Effects of OCS Petroleum Development,' September 1978. p 87-92, 1 tab.

Descriptors: *Oil pollution, *Water pollution effects, *Baseline studies, *Morphology, *Toxicity, Salmonids, Fish, Alaska, Arctic, *Outer Continental Shelf, Petroleum hydrocarbons, Environmental stress, Flatfish, Prudhoe Bay, Crude oil.

The two major objectives are to identify the effects of petroleum on fish at the cellular level and to establish which tissues show that most obvious and repeatable structural alterations. A series of experimental designs have been followed to assess the effects of Prudhoe Bay crude oil or its water-soluble fraction on both pelagic and demersal species and on adult and young. The findings are reported by considering each major target organ and describing the alterations observed for each type of experiment and variation. The common theme is the type of cellular response of selected organs or tissues to toxic substances; namely, petroleum hydrocarbons. The observed liver changes parallel hepatic alterations known for other animals to be pre-neoplastic. These changes indicate that the ability of fish to survive additional routine environmental stress may be reduced because of depletion of energy reserves or reduced liver functions. OVERVIEW,
National Marine Fisheries Service, Seattle, WA. Northwest and Alaska Fisheries Center.
D. C. Malins.
In: NOAA Technical Memorandum ERL OCSEAP-1, 'Marine Biological Effects of OCS Petroleum Development' September 1978. p 92-105.

Descriptors: *Water pollution effects, *Oil pollution, *Baseline studies, *Heavy metals, Alaska, Arctic, Invertebrates, Bibliographies, *Outer Continental Shelf, Petroleum hydrocarbons.

Results of a number of studies indicate that many marine invertebrates, particularly larval forms, are highly susceptible to petroleum pollution. Research on the biological fate of aromatic hydrocarbons in larval invertebrates has shown that these developmental stages can substantially bioconcentrate aromatic hydrocarbons from the water column. The feeding and reproductive behavior of two marine invertebrates, shrimp and nudibranchs, and the embryonic development of nudibranchs, also appear to be particularly sensitive to low levels of petroleum hydrocarbons in seawater. Studies on the biologica fate of heavy metals in arctic and subarctic marine organisms reveal that metals are bioconcentrated, and accumalate in certain organs. Slight elevations in concentrations to toxic metals above levels found in seawater can alter the metabolism of aromatic hydrocarbons. This finding support the hypothesis that increases in metal present in polluted environments, possibly arising from petroleum operations, may significantly alter the biological fate of aromatic hydrocarbons in marine organisms. BIOAVAILABILITY OF HYDROCARBONS AND HEAVY METALS TO MARINE DETRITIVORES FROM OIL-IMPACTED SEDIMENTS,
Battelle Pacific Northwest Lab., Sequim, WA. Marine Research Lab.
J. W. Anderson, G. Roesijadi, and E. A. Crecelius.
In: NOAA Technical Memorandum ERL OCSEAP-1, 'Marine Biological Effects of OCS Petroleum Development,' September 1978. p 130-148, 1 fig, 8 tab, 30 ref.

Descriptors: *Oil pollution, *Water pollution effects, *Sediments, Baseline studies, Heavy metals, Benthos, Alaska, *Outer Continental Shelf, Hydrocarbons, Petroleum hydrocarbons, Detritivores, Protothaca staminea, Macoma inquinata, Phascolosoma agassizii.

Studies were conducted to assess the potential damage of oil-contaminated marine sediments on benthic organisms and the availability of this material to marine food-webs and eventually man. There appears to be a tissue accumulation pattern associated with the molecular weight of the petroleum hydrocarbon, which is probably dependent on relative partitioning coefficients. From other studies it seems that tissue retention times, while animals are in clean water, increases with the size of the hydrocarbon, and the number of side chains (alkylation). No single study with one organism and one type of system has been conducted to produce these data, but the basic pattern appears to exist. Present evidence indicates that hydrocarbons bound to sediment particles are not directly available to deposit/detritus-feeding organisms. (See also W79-01788)
W79-01798

ACTIVITY-DIRECTED FRACTIONATION OF PETROLEUM,
Battelle Memorial Inst. Columbus, OH.
J. S. Warner.
In: NOAA Technical Memorandum ERL OCSEAP-1, 'Marine Biological Effects of OCS Petroleum Development,' September 1978. p 149-155, 2 fig, 1 tab, 7 ref.

Descriptors: *Oil pollution, *Water pollution effects, Baseline studies, Alaska, *Outer Continental Shelf, Petroleum, Petroleum hydrocarbons, Crude oil, Fractionation.

The program on activity-directed fractionation of petroleum is in its formative stage so there are no results yet to present and discuss. This presentation describes the basis for the program, its objectives, and the research plan. Generally the chemical analyses are limited to the determination of components that can be detected most easily, the volatile and semivolatile hydrocarbons that can be detected by gas chromatography. Unfortunately petroleum is also comprised of many other components including nonvolatile and polar components. The research program is designed to assess the potential biological activity of these generally ignored petroleum components. Since normal paraffins are degraded relatively rapidly by microorganisms and the toxic light aromatic hydrocarbons are rapidly lost from an oil slick by dissolution and evaporation, any program concerning the potential long-term biological effects of an oil spill needs to consider the other components remaining in weathered petroleum. W79-01799

POTENTIAL INTERACTION OF MICROORGANISMS AND POLLUTANTS FROM PETROLEUM DEVELOPMENT,
Louisville Univ., KY. Dept. of Biology.
R. M. Atlas.
In: NOAA Technical Memorandum ERL OCSEAP-1, 'Marine Biological Effects of OCS Petroleum Development,' September 1978. p 156-166, 2 fig, 1 tab, 8 ref.

Descriptors: *Water pollution effects, *Oil pollution, *Microorganisms, *Alaska, Baseline studies, Weathering, Ice, *Outer Continental Shelf, Petroleum hydrocarbons, Light hydrocarbons.

As a result of data gathered ancillary to reconnaissance and fate of oil studies, some limited results have been found on the effects of oil on microorganisms. It was found that hydrocarbons are degraded very slowly. Persistence from a moderate oil spill must be thought of in terms of years instead of days, or months. Under certain conditions, such as under ice the physical evaporative losses of light hydrocarbons, many of which are highly toxic, are greatly restricted. Similarly losses of light hydrocarbons in sediment appear to be restricted due to adsorption. Components, such as naphthalene, are found still present weeks after spillage under ice. The implication of this finding is that low molecular weight oil components will reside for prolonged periods under certain conditions in Alaska ecosystems. In contrast to sediment and under ice, volatile components are lost within days from open water spillages. The residual oil recovered from these studies had the same composition of the oil in terms of component classes as the freshly spilled oil. (See also W79-01788) (Sinha - OEIS)
W79-01800

MICROBIAL ACTIVITY AND CRUDE OIL-MICROBIAL INTERACTIONS IN WATER AND SEDIMENTS,
Oregon State Univ., Corvallis. Dept. of Microbiology; and Oregon State Univ., Corvallis. School of Oceanography.
R. Y. Morita, R. P. Griffiths, T. M. McNamara, and S. E. Steven.
In: NOAA Technical Memorandum ERL OCSEAP-1, 'Marine Biological Effects of OCS Petroleum Development, 'September 1978. P 167-187, 11 fig, 3 tab, 3 ref.

Descriptors: *Water pollution effects, *Oil pollution, Microorganisms, *Biodegradation, Baseline studies, *Alaska, Sediments, Food webs, Bacteria, Nitrogen fixation, *Outer Continental Shelf, Crude oil, Cook Inlet.

Research efforts deal mainly with direct counts of the microbial population (epifluorescent counts), heterotrophic activity at in situ temperature, and laboratory studies dealing with microbial functions at low temperature in relation to petroleum degradation (crude oil used from the specific locality), nitrogen fixation, chitinase activity, etc. in the presence and absence of crude oil. The relative microbial activity as determined by the heterotrophic potential method for the Lower Cook Inlet during April and October cruises are presented. The highest level of activities were seen in the northern-most stations using either glucose or glutamic acid as substrates. Lower values offshore were observed to the southwest of Kamishak Bay, in the center of the inlet. Values found in Kachemak Bay were still lower, and those values seen in the south and southeastern sections were the lowest. This is very similar to the pattern of relative microbial uptake that was seen in water samples analyzed during the fall 1976 cruise in the same area. (See also W79-01788) (Sinha-OEIS)

INFLUENCE OF PETROLEUM ON EGG FORMATION AND EMBRYONIC DEVELOPMENT IN SEABIRDS,
California Univ. at Davis, Stinson Beach. Point Reyes Bird Observatory.
D. G. Ainley, and C. R. Grau.
In: NOAA Technical Memorandum ERL OCSEAP-1, 'Marine Biological Effects of OCS Petroleum Development,' September 1978. P 188-198, 4 tab, 8 ref.

Descriptors: *Oil pollution, *Water pollution effects, *Birds, *Reproduction, Baseline studies, California, Alaska, *Outer Continental Shelf, Seabirds, Crude oil, Bunker C oil, Prudhoe Bay, Ptychoramphus aleutica, Larus occidentalis.

This study appraises the effects that a brief exposure to an oil spill would have on the reproduction of Cassin's Auklets (Ptychoramphus aleutica) and on Western Gulls (Larus occidentalis) nesting on the Farallon Islands of California. These species are representative of many birds breeding along the Pacific Coast that are at risk from oil pollution during the reproductive period. Females of breeding pairs of auklets were dosed with bunker C oil or empty capsules as controls, and egg production, hatching success, and fledging success were determined. Samples of eggs were compared in regard to yolk structure, presence of oil components, and embryonic development. Attempts to dose gulls were unsuccessful. (See also W79-01788) (Sinha OEIS)

Johns Hopkins Univ., Baltimore, MD. Dept. of Pathobiology.
S. M. Patten, Jr., and L. R. Patten.
In: NOAA Technical Memorandum ERL OCSEAP-1, 'Marine Biological Effects of OCS Petroleum Development,' September 1978. P 199-215, 10 fig, 5 tab, 13 ref.

Descriptors: *Oil pollution, *Water pollution effects, *Birds, *Breeding, Ecology, Alaska, Baseline studies, *Outer Continental Shelf, Petroleum hydrocarbons, Crude oil, North Slope, Gulf of Alaska, Herring gulls, Larus argentatus, Larus glaucescens.

An analysis is given of the effects of petroleum exposure on the breeding ecology, including incubation behavior and hatching success, of the Gulf of Alaska Herring Gull group (Larus argentatus Larus glaucescens). Conclusions from the experiments are: very small amounts of North Slope Crude Oil exposure to gull eggs in the field, early stages of incubation, lead to high embryonic mortality. Embryonic resistance to petroleum exposure increases with the duration of incubation. Mineral oil in equivalent microliter doses causes no significant mortality. (See also W79-01788) (Sinha OEIS)

EFFECTS OF OILING ON TEMPERATURE REGULATION IN SEA OTTERS,
Scripps Institution of Oceanography, La Jolla, CA. Physiological Research Lab.
G. Kooyman, and D. Costa.
In: NOAA Technical Memorandum ERL OCSEAP-1, 'Marine Biological Effects of OCS Petroleum Development,' September 1978. P 210-221, 2 fig, 3 ref.

Descriptors: *Oil pollution, *Water pollution effects, *Water temperature, Animal metabolism, Mammals, Otters, Baseline studies, Respiration, *Outer Continental Shelf, Crude oil, Enhydra lubris.

Two otters are presently being studied at the Physiological Research Laboratory, Scripps Institution of Oceanography. After conditioning the otters accepted confinement in the metabolic test chamber, and their normal metabolic rates were measured at a variety of water temperatures. To date six hour metabolic runs at six different water temperatures between 5 and 30C have been made. The thermal neutral zone for otters has been preliminarily established and appears to have a lower critical temperature between 5 and 10C. Prudhoe crude oil has been applied to one otter on two different occasions and changes in metabolic rate after oiling and washing have been made. The application of 38 mls and 60 mls of crude oil upon the dorsal surface of the sea otter increased the otter's average metabolic rate 24% and 60% respectively. However, two weeks after the oiling experiment, routine blood samples were taken from both otters for routine examination and the otter which had been oiled exhibited an unusually high white blood cell count. The otter was then transferred to Sea World for veterinary care and is currently still at Sea World suffering from what is believed to be a deep seated pneumonia. The pneumonia is probably a result of the stress encountered by the otter during the post-washing period. (See also W79-01788) (Sinha-OEIS)
W79-01804

AN OVERVIEW OF NOAA'S ENERGY RESOURCES PROJECT ON FATE AND EFFECTS OF CONTAMINANTS IN MARINE ECOSYSTEMS AND ORGANISMS,
National Oceanic and Atmospheric Administr

on, Boulder, CO. Environmental Research Lab.
. A. Wolfe.
: NOAA Technical Memorandum ERL-CSEAP-1, 'Marine Biological Effects of OCS etroleum Development,' September 1978. P 223-25, 5 ref.

escriptors: *Water pollution effects, *Oil pollu-on, *Environmental effects, Marine biology, Eco-stems, Baseline studies, *Outer Continental helf, Petroleum development.

he general objectives of the National Oceanic d Atmospheric Administration's (NOAA) ergy resources project on fate and effects are to entify and conduct laboratory and field research udies that will facilitate the assessment of poten-l environmental impacts from petroleum releases coastal marine ecosystems. This effort does not ve a site-specific orientation; instead, it is fo-sed on the fundamental processes that control e distribution, transport, and effects (including ysiological and ecological aspects) of petroleum mponents, toxic metals, and other contaminants coastal ecosystems. It is expected that the results the process-oriented studies conducted under is project will have broad applicability to envi-nmental problems in widely separated geograph-areas. HE NOAA NATIONAL ANALYTICAL FA-LITY -- A STATUS REPORT,
ational Oceanic and Atmospheric Administra-n, Boulder, CO. Environmental Conservation v.
D. MacLeod, Jr., D. W. Brown, and L. C. omas.
NOAA Technical Memorandum ERL-CSEAP-1, 'Marine Biological Effects of OCS troleum Development,' September 1978. p 226-7, 3 fig, 2 tab, 6 ref.

escriptors: *Water pollution, *Environmental ef-ts, *Facilities, *Research facilities, Baseline dies, Resources development, *Outer Continen-Shelf, Research priorities.

e NOAA National Analytical Facility was es-lished at the Northwest and Alaska Fisheries nter to provide NOAA's environmental pro-ams with detailed information on the types and ounts of trace chemical contaminants in the rine environment. The Facility is associated h an experienced multidisciplinary team of emists, biochemists, biophysicists, and physiolo-ts engaged in studies on contaminant-induced anges in marine biota. Interaction with this team scientists is important in relating the analytical rk of the Facility to environmental issues and cing interpretations of the data in an environ-ntal perspective. As part of its on-going re-rch, the Facility is investigating applications of h pressure liquid chromatography and ultravio-fluorescence spectrometry for the analysis of oil d its toxic constituents. These techniques should developed into new standard methods which uld then be compared with the existing ones. is applies especially to the analysis of the aroma-constituents of petroleum and their transforma-n products. SSIBLE TRACE METAL MOBILIZATION SELECTED TRACE ELEMENTS FROM L-IMPACTED SEDIMENTS,
lorado Univ., Boulder. Dept. of Chemistry.
. Miller, R. E. Sievers, G. Lange, J. Stanley, R. R. Meglen.
NOAA Technical Memorandum ERL-SEAP-1, 'Marine Biological Effects of OCS roleum Development,' September 1978. p 238-, 1 fig, 4 tab.

scriptors: *Oil pollution, *Water pollution ef-ts, *Sediments, *Trace elements, *Heavy als, Testing procedures, Baseline studies, Mer-y, Arsenic, Chromium, Nickel, *Outer Conti-tal Shelf, Petroleum hydrocarbons, Crude oil.

Research efforts at the University of Colorado were undertaken to experimentally test whether selected trace metals can be mobilized or released from oil-impacted sediments in natural seawater. Release of trace elements from either the bottom or, less importantly, from the crude oil (the potential for trace element release from oil itself is somewhat less than the potential release from the bottom sink due to interaction with constituents of petroleum) could alter the trace element concentrations potentially available to the ocean flora and fauna. Four target elements--mercury, arsenic, chromium, nickel--were studied. Under the experimental conditions used, results do not indicate any mobilization for three of the selected target metals occurring as the result of the interaction of oil upon sediments. Work is currently in progress for the remaining target element. (See also W79-01788) (Sinha-OEIS)

THE EFFECTS OF PETROLEUM HYDROCARBONS ON CHEMORECEPTION IN DUNGENESS CRAB CANCER MAGISTER.
National Marine Fisheries Service, Highlands, NJ. Middle Atlantic Coastal Fisheries Center.
B. L. Olla.
In: NOAA Technical Memorandum ERL-OCSEAP-1, 'Marine Biological Effects of OCS Petroleum Development,' September 1978. p 244-249, 12 ref.

Descriptors: *Oil pollution, *Water pollution effects, *Animal behavior, Baseline studies, Crabs, *Outer Continental Shelf, *Petroleum hydrocarbons, Chemoreception, Cancer magister, Feeding behavior.

Food detection and gathering, predator recognition and escape, establishment and maintenance of commensal, symbiotic and parasitic relationships, and courtship and mating are all behaviors heavily relying upon chemoreception. The effect of petroleum upon those behaviors was investigated mediated by chemoreception in the Dungeness crab, Cancer magister. It was found that antennular flicking rate changes indicate that blue crabs can detect the hydrocarbons, naphthalene and methylnaphthalene, in seawater solution. The detection threshold for naphthalene is higher than for the DECE, and the threshold for methylnaphthalene is considered higher than that for naphthalene. Such results indicate tha antennular behavior in the blue crab may be a general response to any chemical change of the crab's environment. The usefulness of behavioral assays based upon antennular motion for other crabs and a variety of chemicals, natural and artificial, seems quite promising. (See also W79-01788) (Sinha-OEIS)
W79-01808

INTERACTIVE EFFECTS OF RESIDUES OF HYDROCARBONS, CHLORINATED HYDROCARBONS, AND HEAVY METALS ON THE METABOLISM AND BIOACCUMULATION OF PETROLEUM HYDROCARBONS IN MARINE FISH,
National Marine Fisheries Service, Seattle, WA. Northwest and Alaska Fisheries Center.
E. H. Gruger, Jr., J. W. Hawkes, and D. C. Malins.
In: NOAA Technical Memorandum ERL-OCSEAP-1, 'Marine Biological Effects of OCS Petroleum Development,' September 1978. p 250-269, 2 fig, 37 ref.

Descriptors: *Oil pollution, *Water pollution effects, *Chlorinated hydrocarbon pesticides, *Metabolism, Heavy metals, Fish, Salmonids, Baseline studies, *Outer Continental Shelf, *Hydrocarbons, Petroleum hydrocarbons, Chlorobiphenyls, Bioaccumulation, Oncorhyncus, Salmo.

Research has uncovered some important factors that deal with interactive biochemical and morphological effects of contaminants in organisms in the marine environment. Species difference, wide variations among individual fish to respond biochemically to contaminants, and the potential for simultaneous interactions of chemicals from more than one class are factors which must be seriously considered in attempting to resolve environmental problems. The research specifically leads to the conclusion that chlorobiphenyls may either enhance or retard the normal biotransformations of petroleum aromatic hydrocarbons in exposed fish, in terms of responses of the hepatic microsomal AHH systems in chinook and coho salmon. Moreover, morphological changes occur in salmon as a result of food-path exposures of chlorobiphenyls and hydrocarbons; the changes appear less severe when the chemical classes are administered separately to the fish. Importantly, synergistic action by the two types of chemicals were apparent in morphological changes and increases in liver AHH activities for exposed salmon. The finding varied AHH activities relative to different substrates has important implications about the metabolism of petroleum hydrocarbons. (See also W79-01788) (Sinha-OEIS)

DESIGN OF FIELD EXPERIMENTS TO DETERMINE THE ECOLOGICAL EFFECTS OF PETROLEUM IN INTERTIDAL ECOSYSTEMS,
Resource Management Associates, Lafayette, CA.
S. F. Moore, and D. B. McLaughlin.
In: NOAA Technical Memorandum ERL-OCSEAP-1, 'Marine Biological Effects of OCS Petroleum Development,' September 1978. p 270-290, 5 fig, 2 tab, 6 ref.

Descriptors: *Oil pollution, *Water pollution effects, *Intertidal areas, *Ecosystems, *Baseline studies, Environmental effects, Resources development, Testing procedures, Ecology, *Outer Continental Shelf, Petroleum hydrocarbons, Field experiments.

A primary goal of field experiments is to learn more about causal relationships between controlled perturbations (treatments) and field observations. Specifically the goal is to design experiments which address the following objective: To study in the upper rocky intertidal community the effects on species abundance and distribution of various amounts and compositions of petroleum substances which may disturb the natural system in the following ways: physical/chemical disturbance, direct competition for space, disruption of competition and predation, and interaction with natural physical disturbances such as wave exposure and dessication. This paper highlights and summarizes the results of the study which resulted in a set of ecological and statistical design criteria to guide the translation of this overall objective into specific experimental designs. ENVIRONMENTAL ASSESSMENT OF ALASKAN CONTINENTAL SHELF. FINAL REPORTS OF PRINCIPAL INVESTIGATORS, VOL 1, BIOLOGICAL STUDIES.
National Oceanic and Atmospheric Administration, Boulder, CO. Outer Continental Shelf Environmental Assessment Programs.
Final Reports of Principal Investigators, Vol 1, June 1978. 490 p.

Descriptors: *Oil pollution, *Water pollution effects, *Baseline studies, *Resources development, Alaska, Plankton, Fishes, Biota, Invertebrates, Birds, Bibliographies, *Outer Continental Shelf, *Petroleum hydrocarbons, Lethal effects, Sublethal effects.

Seven final reports on baseline studies of the aquatic fauna and ecology of the Alaskan Continental Shelf which assess the environmental effects of petroleum developments in that area are compiled in this volume. Titles are: Lethal and Sublethal Effects on Selected Alaskan Marine Species after Acute and Long-term Exposure to Oil and Oil Components; Food and Feeding Relationships in the Benthic and Demersal Fishes of the Gulf of Alaska and Bering Sea; A Review of the Leterature and a Selected Bibliography of Published and Unpublished Literature on Marine Birds of Alaska; Determination and Description of Kknowledge of the Distribution, Abundance, and Timing of Sal-

monids in the Gulf of Alaska and Bering Sea; Ichtyoplankton of the Eastern Bering Sea; Environmental Assessment of the Southeastern Bering Sea: Zooplankton and Micronektona; and Trawl Survey of the Epifaunal Invertebrates of Norton Sound, Southeastern Chuckchi Sea, and Kotzebue Sound. (See W79-01812 thru W79-01817) (NOAA)
W79-01811

LETHAL AND SUBLETHAL EFFECTS ON SELECTED ALASKAN MARINE SPECIES AFTER ACUTE AND LONG-TERM EXPOSURE TO OIL AND OIL COMPONENTS,
National Marine Fisheries Service, Auke Bay, AK. Northwest and Alaska Fisheries Center.
S. D. Rice, S. Korn, and J. F. Karinen.
In: NOAA/ERL Outer Continental Shelf Environmental Assessment Program, Final Reports of Principal Investigators, Vol. 1, Biological Studies, June 1978. P 1-32, 2 tab, 25 ref. R7120822.

Descriptors: *Oil pollution, *Water pollution effects, *Toxicity, Alaska, Biota, Environmental effects, Baseline studies, *Outer Continental Shelf, Bering Sea, Beaufort Sea, Sublethal effects.

The research involves physiological and bioassay testss of applied research on species indigenous to the Gulf of Alaska, Bering Sea, and Beaufort Sea. The major emphasis has shifted from strictly descriptive acute toxicity determinations to mechanistic studies and sublethal tests that will eventually allow prediction of oil impacts on the biota. The studies have two basic themes. Toxicity challenge experiments, where sensitive species, live stages, factors that affect toxicity, or components that are most responsible for toxicity are identified; and sublethal physiological response, where physiological responses that are indicative of oil stress are identified, measured, and characterized. (See also W79-01811) (Sinha - OEIS)
W79-01812

FOOD AND FEEDING RELATIONSHIPS IN THE BENTHIC AND DEMERSAL FISHES OF THE GULF OF ALASKA AND BERING SEA,
Alaska Univ., College. Inst. of Marine Science.
R. L. Smith, A. C. Paulson, and J. R. Rose.
In: NOAA/ERL Outer Continental Shelf Environmental Assessment Program, Final Reports of Principal Investigators, Vol 1, Biological Studies, June 1978. P 33-107, 2 fig, 28 tab, 48 ref.

Descriptors: *Water pollution effects, *Baseline studies, *Food habits, Marine fish, Oil pollution, Resources development, Benthos, *Outer Continental Shelf, Gulf of Alaska, Bering Sea, Demersal fish.

The rationale behind this study was to develop an ability to predict the impact of oil developmet activities on the fishes in these two areas. The study, coupled with others designed to study acute and chronic toxic effects on the fish populations, will help establish the predictive base necessary to make management decisions. The research findings on polock, rex sole, rock sole, dover sole, flathead sole, arrowthooth flounder, Greenland halibut, capelin and shortfin eelpout are discussed. Existing information on Pacific cod, yellowfin sole and Pacific halibut is summarized. (See also W79-01811) (Sinha - OEIS)
W79-01813

A REVIEW OF THE LITERATURE AND A SELECTED BIBLIOGRAPHY OF PUBLISHED AND UNPUBLISHED LITERATURE ON MARINE BIRDS OF ALASKA,
Fish and Wildlife Service, Anchorage, AK. Office of Biological Services and Coastal Ecosystems.
J. C. Bartonek, and C. J. Lensink.
In: NOAA/ERL Outer Continental Shelf Environmental Assessment Program Final Reports of Principal Investigators Vol 1 Biological Studies, June 1978. P 108-204, 1 fig, 1 tab. o1-06-022-11437.

Descriptors: *Birds, *Bibliographies, *Water pollution effects, Environmental effects, Baseline studies, Alaska, Oil pollution, *Outer Continental Shelf, *Petroleum development, Literature reviews, Bering Sea, Gulf of Alaska.

A bibliography of more than 900 references published before and during 1976 on birds of the coastal and marine environment with emphasis being on those birds from Alaska and adjacent areas is contained in this report. A cursory review of some of that information was made. The purpose of this report is to facilitate the identification of literature that is of regional ana topical importance in describing coastal and marine avifaunas and in assessing impacts upon those avifaunas from whatever causes. (See also W79-01811) (Sinha - OEIS)
W79-01814

DETERMINATION AND DESCRIPTION OF KNOWLEDGE OF THE DISTRIBUTION, ABUNDANCE, AND TIMING OF SALMONIDS IN THE GULF OF ALASKA AND BERING SEA. A SUPPLEMENT,
Washington Univ., Seattle. Fisheries Research Inst.
D. E. Rogers.
In: NOAA/ERL Outer Continental Shelf Environmental Assessment Program, Final Reports of Principal Investigators, Vol 1, Biological Studies, June 1978. P 205-235, 9 fig, 11 tab, 3 ref.

Descriptors: *Salmon, *Water pollution effects, Baseline studies, Environmental effects, Alaska, Oil pollution, Outer Continental Shelf, Petroleum development, Gulf of Alaska, Bering Sea, Bristol Bay.

The annual variation in abundance and seasonal timing of the migrations of adult and juvenile (smolt) salmon since 1951 in the nearshore waters of Bristol Bay is described. The number of juvenile or adult salmon that migrate through Bristol Bay in an average year is best measured by the median number because the annual numbers are not normally distributed. The medians and ranges in the annual numbers of salmon are given in tabular form. In most years there is either a large abundance of smolts or a large abundance of adults. Years in which there are very large numbers of sockeye salmon occur at 4- or 5-year intervals. Juvenile pink salmon are usually present only in odd-numbered years and adult pink salmon are usually present only in even-numbered years. The Naknek-Kvichak District produced 36% of the smolts and 54% of the adult salmon in Bristol Bay in an average year; whereas, the Nushagak District produced 50% of the smolts but only 25% of the adults in Bristol Bay in an average year. Salmon are present in Bristol Bay from May through September; however, they are most abundant in June and July when there are usually millions of adults and hundreds of millions of smolts that are passing each other in their migrations to and from Bristol Bay. (See also W79-01811) (Sinha - OEIS)
W79-01815

ENVIRONMENTAL ASSESSMENT OF THE SOUTHEASTERN BERING SEA: ZOOPLANKTON AND MICRONEKTON,
Alaska Univ., College. Inst. of Marine Science.
R. T. Cooney.
In: NOAA/ERL Outer Continental Shelf Environmental Assessment Program, Final Report of Principal Investigators, Vol 1, Biological Studies, June 1978. p 238-337, 33 fig, 6 tab, 12 ref, 3 append. 03-5-022-56.

fects, *Invertebrates, Baseline studies, Alaska,
and gas, Oil pollution, Resources developme
*Outer Continental Shelf, Petroleum developme
Environmental impact, Norton Sound, Chuk
Sea, Kotzebue Sound, Epifauna.

It was the primary intent of this investigation
collect information on the composition, distri
tion, and biology of the epifaunal invertebr
components of Norton Sound, southeastern Ch
chi Sea, and Kotzebue Sound. The trawl surv
for the investigation of epifaunal invertebrates
effective, and excellent spatial coverage of
shelf of the northeastern Bering Sea and southe
ern Chukchi Sea was obtained. Taxonomic analy
of the invertebrates collected in the Norton Sou
area delineated 13 phyla and 187 species; Chuk
Sea - Kotzebue Sound invertebrates consisted o
phyla and 171 species. Echinoderms made up
bulk of the invertebrate biomass with 80.3% in
Norton Sound region and 59.9% in the Chuk
Sea - Kotzebue Sound region. Other import
phyla were Arthropoda and Mollusca. The imp
tance of deposit-feeding clams in the diet of sta
flounders and sea stars is demonstrated. A h
probability exists that oil hydrocarbons will e
starry flounders, sea stars and other bivalve pr
ators via deposit-feeding molluscs, suggesting
studies interrelating sediment, oil, deposit-feed
clams, and appropriate predator species should
initiated soon. (See also W79-01811) (Sinh

COMMUNITY STRUCTURE, DISTRIBUTION, AND INTERRELATIONSHIPS OF MARINE BIRDS IN THE GULF OF ALASKA,
Oregon State Univ., Corvallis.
J. A. Wiens, D. Heinemann, and W. Hoffman.
In: NOAA/ERL Outer Continental Shelf Environmental Assessment Program, Final Reports of Principal Investigators, Vol 3, Biological Studies, June 1978. P 1-175, 58 fig, 24 tab, 55 ref.

Descriptors: *Baseline studies, *Water pollution effects, *Environmental effects, *Birds, Aquatic birds, Ecosystems, Alaska, Resources development, *Outer Continental Shelf, Gulf of Alaska, Petroleum development, Environmental assessment, Feeding flocks, Aves.

A standardized method for transect censusing of marine birds from shipboard at sea is described. All birds seen in an arc of 90 degrees, from the bow to one beam, are recorded over 15-30 min transect runs. For each sighting, the number of birds, species, distance, the angle from the transect line to the birds, and the direction of flight of flying birds are recorded. The various methods of transect-based density estimation are considered, the major findings of studies of marine bird distribution and abundance in the Gulf of Alaska are detailed, and the patterns of organization typifying mixed species feeding flocks in this region are described. Views regarding the influences of petroleum development on the populations and population attributes are evaluated. (See also W79-01822) (Sinha-OEIS)
W79-01823

RECONNAISSANCE OF THE INTERTIDAL AND SHALLOW SUBTIDAL BIOTIC LOWER COOK INLET,
Dames and Moore, Homer, AK.
D. C. Lees.
In: NOAA/ERL Outer Continental Shelf Environmental Assessment Program, Final Reports of Principal Investigators, Vol 3, Biological Studies, June 1978. p 179-506, 24 fig, 35 tab, 15 ref.

Descriptors: *Baseline studies, *Surveys, *Intertidal areas, Water resources, Benthos, Biota, Alaska, Geological surveys, *Outer Continental Shelf, Cook Inlet, Resources management, Airborne surveys, Subtidal areas, Petroleum development.

A reconnaissance survey of the intertidal and shallow habitats of lower Cook Inlet was conducted during May, June, July and August 1976. This survey comprised an aerial reconnaissance of the west side of the inlet and examination of several sites in representative habitats in the intertidal and shallow subtidal zones on both sides of the inlet. Species compositions and complexity of the biotas vary distinctly by substrate. The intertidal faunal assemblages were basically dominated by the same species, but their diversity, robustness and maturity differed dramatically. If the benthic assemblages of Cook Inlet are divided into export systems (producing more plant material (energy) than required to maintain their faunal assemblages) and inport systems (producing less plant material than necessary to support their faunal assemblages and therefore importing plant material), an interesting and important pattern is observed. The water circulation regime is certainly sufficiently dynamic to facilitate the transport of plant materials to import systems. The apparent patterns in the distribution of import and export assemblages are important in understanding the inter-relationships of the Cook Inlet system and should provide some very useful tools in planning resource management and petroleum development in lower Cook Inlet. Descriptors: *Mapping, *Intertidal areas, Water resources, *Surveys, *Baseline studies, Alaska, Vegetation, Algae, *Outer Continental Shelf, *Airborne surveys, Petroleum development.

Multispectral analysis was performend on a data set collected by low flying aircraft at three sites in the Gulf of Alaska, i.e., Zaikof Bay, Latouche Point and Cape Yakatadga for the purpose of mapping intertidal algal communities. Both supervised and unsupervised processing procedures were employed. It is possible to separate vegetation into broad spatial zones representing either species of algae of species associations or simply vegetation density classes. Clustering techniques represent the most effective way to extract training signatures. A minimum of four spectral bands is needed to achieve the recognition performance levels demonstrated in the study. Two channels in the visible (green and red), one in the near-infrared region and one in the thermal region were found most useful. A hypothetical intertidal survey of 1200 miles of Alaska shoreline is outlined with summaries of data collection and processing costs given for the mission using optimum spectral bands. Descriptors: Lakes, *Productivity, *Morphology, *Plant growth, *Nutrients, *Algae, Fisheries, *Alaska, *Recreation, Regression analysis, Tropic levels, *Morphoedaphic indices(Lakes), Tanana Lakes(Alas).

Results of work on two different lake areas, each a recreational focus for a large city in Alaska are presented. The productivity of these lakes has been classified according to their morphoedaphic index (MEI). This is the ratio between an edaphic (effects due to soil) factor usually measured as total dissolved solids (total residues), and a morphometric parameter, namely mean depth. Shindler's model for a particular morphoedaphic index, which is the ratio of the area of the lake and its watershed to the lake volume, was applied to data taken at the Tanana Lakes near Fairbanks. The regressions of various algal growth parameters with Schindler's index gave insignificant r's. This is likely due to the small variation in these parameters between the lakes. It is also likely due to the fact that any morphoedaphic index is most likely to regress strongly with measurements of the total production of a trophic level from lake to lake, and algal production is only a fraction of total primary production in these lakes.

Descriptors: Habitats, *Pennsylvania, *Mosquitoes, *Heavy metals, *Wastewater irrigation, E. coli, *Chlorinated sewage effluents, *Wildlife, Ecology, *Arthropods, *Habitat alteration, *White-footed mice, *Forest habitat, Condition indices, Blood profiles, Cottontail rabbit, Arbovirus activity, Coccidiosis, Helminth infections, Meadow vole, Passerine birds.

In Pennsylvania, forest habitats irrigated with wastewater showed an increase in the abundance of vegetation at the lower layer. Arthropod abundance in this layer also increased. The overall abundance of passerine birds increased in the irrigated aspen-pine-shrub type, but decreased in the mixed-oak. The accumulation of heavy metals in voles inhabiting the reed canarygrass field was not significant, and concentrations of lead and cadmium in mice inhabiting the wastewater-treated forest plots were not considered hazardous. The prevalence of antibody for arboviruses ranged from 0 to 3.5 percent in rabbits from areas which will be included in the expansion of the wastewater-irrigation system. Five of the arboviruses being transmitted are potential pathogens to humans and borne primarily by mosquitoes. Body measurements, samples of blood, and organ tissues from wild rabbits were collected from the 500-acre area scheduled for future irrigation and a reference area. The level of coccidiosis and the helminth infections of rabbits did not seem to be markedly influenced by age, sex, season, or area. A new species of coccidia was described. Weight/length ratios of body size and population estimates of white-footed mice and meadow voles were obtained during 1974 to 1977. (Sink-Penn St)

CITRIC ACID ENHANCEMENT OF COPPER SULFATE TOXICITY TO BLUE-GREEN ALGAE AND OTHER NUISANCE ORGANISMS,

Missouri Univ.-Kansas City. Dept. of Biology.
M. S. Stern, D. H. Stern, and L. L. Ray

Available from the National Technical Information Service, Springfield, VA 22161 as PB-289 490, Price codes: A05 in paper copy, A01 in microfiche. Missouri Water Resources Research Center, University of Missouri, Columbia Completion Report, November 30, 1978. 84 p, 13 fig, 23 tab, 56 ref. OWRT A-099-MO(2), 14-34-0001-7053, 7054 and 8027.

Descriptors: *Copper sulfate, *Citric acid, Algae, Algicides, Toxicity, Toxicity tests, *Cyanophyta, Microcystis, Aphanizomenon.

Copper toxicity tests were carried out using two species of blue-green algae, Aphanizomenon flos-aquae and Microcystis aeruginosa. Copper concentrations of 300 microgram/liter or higher inhibited the growth of Aphanizomenon. The addition of 600 microgram Cu++/liter was the minimum copper concentration necessary to inhibit Microcystis growth over a 14-day experimental period. Copper solubility and cupric ion toxicity were enhanced by the addition of citric acid. Citric acid had no adverse effects on the algicidal properties of copper sulfate. A ratio of citric acid at eight times the weight of copper sulfate pentahydrate at a copper concentration of 500 microgram/liter (8:1 citrate-copper sulfate mixture) was inhibitory to Microcystis growth over a 14-day period, whereas the addition of 500 microgram Cu++/liter alone was not. The 8:1 mixture had the same effects as the addition of 600 microgram Cu++/liter. The increased cupric ion toxicity was not due to a pH effect.

HARRY'S BROOK - A SURVEILLANCE REPORT OF PHYSICAL CONDITIONS AND BIOLOGICAL HEALTH,

Rutgers - The State Univ., New Brunswick, NJ. Water Resources Research Inst.
W. Whipple, Jr., A. W. McIntosh, and J. M. DiLouie.

Available from the National Technical Information Service, Springfield, VA 22161 as PB-289 489, Price codes: A03 in paper copy, A01 in microfiche. Partial Technical Completion Report, September 1978. 38 p, 9 fig, 3 tab, 8 ref, append. OWRT A-048-NJ(4), 14-34-0001-8032.

Descriptors: *Water pollution, *Environmental effects, Water quality, Erosion, Flood plain management, Bank erosion, Urban drainage, *New Jersey, *Harry's Brook(NJ), *Stream surveillance, *Biological health of streams.

Streams in urbanizing areas are subject to a variety of stresses produced by the processes of growth; most of the resulting changes are environmentally adverse. Unfortunately, small streams are so numerous and conditions in them may change so rapidly that conventional monitoring networks cannot deal with them. The condition of these streams may be more accurately monitored by biological evaluations than by measurements of the usual water quality parameters. A surveillance of Harry's Brook in Princeton Township, New Jersey, was conducted to evaluate the biological health of the stream, the pollution sources to which it is subject and certain other physical conditions relevant to management. The overall quality of the stream appeared good, although sampling of the benthic macroinvertebrate community in riffles indicated low numbers of both taxa and organisms, although the caddisfly larva Hydropsyche sp. and Cheumatopsyche sp. were found in large numbers in several riffles. Both bank and channel erosion were common, particularly along the main stem of Harry's Brook. As urbanization continues in upstream sections, erosion problems may be expected in these areas.

EFFECTS OF NUTRIENT ENRICHMENT OF A SALT MARSH ON DIATOM COMMUNITIES,

Mississippi State Univ., Mississippi State. Water Resources Research Inst.
M. J. Sullivan.

Available from the National Technical Information Service, Springfield, VA 22161 as PB-289 388, Price codes: A03 in paper copy, A01 in microfiche. Report, 1978. 40 p, 1 fig, 10 tab, 17 ref, 6 pl. OWRT A-114-MISS(1). 14-34-0001-8026.

Descriptors: *Water pollution effects, *Diatoms, *Nitrogen, *Phosphorus, *Salt marshes, Nutrients, Soil algae, Eutrophication, Bioindicators, Biological communities, *Mississippi, Water quality, Community structure, *Graveline Bay Marsh(Miss), Spartina, Nitzschia, Navicula.

Edaphic diatoms were collected on a seasonal basis from a monotypic stand of Spartina alterniflora Loisel. on Graveline Bay Marsh, Mississippi; the marsh surface had been enriched with inorganic nitrogen (N) and/or phosphorus (P). During the winter collection, P and N-P enrichment significantly decreased species diversity (H') while N and P enrichment significantly decreased the number of taxa in a sample. Of the 87 taxa encountered, examination of the distributions of the more abundant ones revealed that nutrient enrichment neither introduced new taxa nor eliminated preexisting taxa. A 2-way ANOVA (treatment x date) of the relative abundances of the 12 most abundant taxa showed that only main effects were significant and only two taxa were significantly affected by the treatments. Nitzschia obsidialis Hust. responded favorably to P enrichment and N. obtusa W. Sm. to N enrichment. Structural similarity between selected pairs of edaphic diatom communities was quantified using a similarity index (SIMI) and values were exceedingly high. The aerial yield of S. alterniflora was unaffected by any of the treatments. In view of the few significant effects of nutrient enrichment found, it was concluded that the edaphic diatom community studied was not subject to N or P limitation.

FACTORS AFFECTING SEDIMENT PHOSPHORUS RELEASE IN LQKE CARL BLACKWELL, OKLAHOMA,

Oklahoma State Univ., Stillwater. School of Civil Engineering.
M. H. Bates, and N. J. Neafus.

Available from the National Technical Information Service, Springfield, VA 22161 as PB-289 60. Price codes: A03 in paper copy, A01 in microfiche. Oklahoma Water Resources Research Institute Oklahoma State University Final Technical Completion Report, 1978. 34 p, 8 fig, 2 tab, 44 re. OWRT A-074-OKLA(1).

Descriptors: *Orthophosphates, *Lake sediment, *Oklahoma, Lakes, *Lake Carl Blackwell(Okla, *Phosphorus, Phosphates, Mixing, Microorganisms, Aerobic conditions, *Anaerobic condition, Nutrients, Water pollution effects.

A laboratory study was conducted to determine the effects of mixing, microorganisms and aerobic and anaerobic conditions on the release of soluble orth-phosphate from lake sediments obtained from Lake Carl Blackwell, Oklahoma. Release was enhanced by mixing, the presence of microorganisms and anerobic conditions. Phosphorus release under aerobic conditions did occur in the experimental systems. However, anaerobic release was greater. The concentration of phosphorus in the overlying water as the result of release from the sediment exceeded, in many cases, the values found in the literature for the limiting concentration of phosphorus for an aquatic system. Phosphorus released from the sediments in Lake Carl Blackwell could support substantial aquatic growth even in the absence of any external nutrient contribution.

, *Eutrophication, *Phosphorus, *Water pollu-
effects, Great Lakes, Lakes, Nutrients, Spatial
ribution, Oligotrophy, Simulation analysis,
del studies, Mathematical models, Hydrodyna-
s, Primary productivity, Water circulation,
tification, Mixing, Upwelling, Water tempera-
, Solar radiation, Algae, Forecasting.

cts of a hypothetical tenfold increase of phos-
rus loading to oligotrophic Lake Superior are
delled, considering both dispersion mechanisms
biological processes which determine spatial
vements of the phosphorus. These movements
simulated using computed currents from a
e-dimensional hydrodynamic model. A biologi-
submodel describes phosphorus dynamics and
ary production in each grid cell of 20 x 20 km.
eased phosphorus loading is applied to two
tions in the lake: (1) a semi-closed bay at the
hwestern end of the lake, and (2) an open
e with strong local currents along the lake's
hwestern edge. The model conveys a number
nportant temporal and spatial scenarios, which
form some of the fundamental blocks for
sidering practical local and lakewide eutrophi-
on problems. Consistent with other studies, it is
cluded that a nutrient-impoverished system like
e Superior's with a low half-saturation constant
sub s) and limited storage capacity, is very
itive to pollution, and once perturbed, the re-
ery time is very lengthy. In Lake Superior K
s related to phosphorus uptake is very low
micrograms P/liter), rendering the model
itive to increased loading. The analysis includ-
ffects on primary production of water circula-
diffusion, thermal stratification, horizontal
vertical diffusion, mixing, upwelling and
nwelling, temperature, and sunlight. Weak-
es of the model are discussed. (Lynch-Wiscon-

on analysis, Algorithms, Greifensee(Switz),
zerland), Monte Carlo method, Self-Consisten-
est, Nutrients.

ethod is presented for evaluating parameter
ation in lake ecosystem modelling, using for
ration data from Greifensee, Switzerland, and
duced version of a complex eutrophication
el of lake phosphorus dynamics. The method,
d the Self-Consistency Test, assigns a weight
rameter self-consistency using additional sim-
d data. Such characteristic features of many
ystem models as complexity, time-variability,
nearity, and sparsity of data demand a reliable
neter estimation startegy to reinforce confi-
e in model results. The reduced model is used
basis for a progressive investigation of the
tiveness of several possible criteria for param-
eter estimation; the last step uses Monte Carlo techniques to supplement the sparse data in order to evaluate the uniqueness and robustness of the estimates as a function of the number of data. Parameter estimation algorithms used at present for nonlinear, multidimensional models are unable to overcome the problem of multimodality of the objective function, and the choice of objective function and sparsity of data can contribute to ambiguous parameter estimates. Although one set of parameters is proposed here, the Self-Consistency Test has certain shortcomings and there are problems in generalizing to other systems: (1) the preferred parameter set may not objectively be the best set; (2) the self-consistency checks could turn into circular arguments, and (3) initial values of parameters can determine the results of the estimates. MARINE ALGAL VEGETATION IN SHALLOW WATER AROUND THE DANISH ISLAND OF SALTHOLM, THE SOUND,
Institut for Sporeplanter, Copenhagen(Denmark).
A. Kristiansen.
Botanisk Tidsskrift, Vol. 72, No. 4, p 203-226, 1978. 12 fig, 7 tab, 33 ref.

Descriptors: *Saltholm(Denmark), *Marine algae, *Floral lists, *Shallow water, *Littoral, Denmark, Baltic Sea, Islands, Algae, Salinity, Coasts, Brackish water, Cyanophyta, Rhodophyta, Phaeophyta, Chlorophyta, Seasonal, Classification, Epiphytes, Fucus vesciculosus.

Seventy-two species of marine algae were collected from shallow water (0-.75 m) within 300 m of the coastline of 7 x 2.5-km Saltholm Island, Denmark, in the Sound. During the survey (May-August 1976) seven sites were studied, and species belonging to Cyanophyceae, Rhodophyceae, Phaeophyceae, and Chlorophyceae were identified. An annotated list of the species, and tables relating species distribution to site, depth, and substrate are given. Surface water temperatures (five-day averages) ranged from 0.9-19.6C over 1976. Salinity fluctuates greatly each day, averaging 11-13%. Water level is very changeable. The supralittoral zone is only weakly developed on Saltholm, and most of the eulittoral zones were without vegetation down to a depth of about 15 cm. In the sublittoral, at a depth of 20-30 cm the dominant Fucus vesciculosus plats were typically covered with about 15 species of epiphytic alge, especially Elachist, Philayella, Ectocarpus, Spongonema, Dictyosiphon, Ceramium, and Polysiphonia. On the lower parts of Fucus (at a depth of 30-35 cm) few epiphytes were found, and the border of the sublittoral is therefor established at that depth. With increasing depth Fucus grows taller and broader, and epiphyte quantity increases, with an increasing abundance of red algae and occurrence of large individuals (10 cm or more). Saltholm's marine algal flora can be considered an outpost of the shallow water flora of the brackish Baltic Sea. Five species new to Denmark were recorded. (Lynch-Winsconsin)

NITROUS OXIDE IN THE OXYGEN MINIMUM OF THE EASTERN TROPICAL NORTH PACIFIC: EVIDENCE FOR ITS CONSUMPTION DURING DENITRIFICATION AND POSSIBLE MECHANISMS FOR ITS PRODUCTION,
Oregon State Univ., Corvallis. School of Oceanography.
Y. Cohen, and L. I. Gordon.
Deep-Sea Research, Vol. 25, No. 6, p 509-524, June, 1978. 8 fig, 2 tab, 58 ref. NR083102, N00014-76-C-0067.

Descriptors: *Nitrous oxide, *Nutrients, *Pacific Ocean, *Denitrification, *Sinks, *Ozone, Oxygen, Oceans, Tropical regions, Nitrogen, Nitrification, Oxygen depletion, Anaerobic conditions, Sea water, Eastern Tropical North Pacific Ocean, Fertilizers, Fossil fuels, Atmosphere, Nitrites, Saturation.

The eastern tropical North Pacific Ocean (ETNP) was found to be a net source for atmospheric nitrous oxide, though of small magnitude (0.14 pg N20/sq cm/sec), and nitrifications may be the most important mechanism for nitrous oxide production in the ETNP. Nitrous oxide plays a major role in controlling stratospheric ozone levels, and increasing use of fertilizers and combustion of fossil fuels is likely to promote ozone depletion. It is thus important to identify and evaluate all significant natural sources and sinks for atmospheric nitrous oxide. This study, which investigated nitrous oxide, oxygen, and nutrient distributions in the ETNP, showed biochemical nitrous oxide consumption around the core of oxygen minimum where denitrification takes place. Subsurface nitrous oxide minima were found at stations where intermediate waters contained near-zero oxygen levels and well-developed secondary nitrite maxima, characteristic of denitrification. Surface waters were saturated and average of 110% with nitrous oxide relative to a marine air content of 287 ppbv. Excpt for the oxygen-deficient layer where nitrous oxide minima were found, nitrous oxide was highly supersaturated at all stations from just below the mixed layer to about 1000 m. Supersaturations varied from 224-600% in shallow waters above the base of the pycnocline, and from 120-250% in waters below 1000 m. Denitrification is not important in nitrous oxide production in seawater, unlike the situation in soils. (Lynch-Wisconsin)

MATHEMATICAL MODELS OF DISSOLVED OXYGEN CONCENTRATION IN FRESH WATER,
Stevens Inst. of Tech. Hoboken, NJ.
L. K. Wang, D. Vielkind, and M. H. Wang.
Ecological Modelling, Vol. 5, No. 2, p 115-123, July, 1978. 2 fig, 2 tab, 15 ref.

Descriptors: Freshwater, Streams, *Mathematical models, *Waste water disposal, *Self-purification, *Dissolved oxygen, Effluents, Biochemical oxygen demand, Water pollution effects, Water pollution control, Oxygen sag, Oxygen depletion, Anaerobic conditions, Computer programs, Model studies, Biological properties, Water quality standards, Equations, Organic matter.

Modsel are presented for biological reactions to anaerobic conditions sand for dissolved oxygen saturation concentration in freshwater, and a brief description is given of the environmetal engineering significance of stream self-puriication, present stream water quality standards on DO concentation, and the solubility of DO in water. The DO saturation concentration model is useful for determining DO deficits, critical DO concentration, and allowable DO. drop in a stream receiving wastewater. Equations for calculating the critical distance (X sub c), the time required to reach the critical distance (T sub c), and the critical DO dificit (D sub c) are given. Unstable organic matter in wastewater accelerates microbiological oxidation and thus rapidly reduces DO concentration. In this paper the effluent is assumed to have low nutrient content and to be nontoxic and biodegradable. Biochemical oxygen demand of the effluent is initially exerted at a rate higher than the atmospheric reaeration rate at the water surface. The DO level decreases, finally reaching the critical point X sub c at which the rte of oxygen utilized for waste decompostion equals the rate of atmospheric reaeration. Further downstream the reaeration rate is greater than the BOD exertion rate and DO begins to increase and eventually the normal cycle is re-established (self-purification). At DO 1.0 mg/1 conditions become anoxic/anaerobic, resulting in hydrogen sulfice and organic sulfide odors, coloration, and destruction of fish and other organisms. (Lynch-Wisconsin)

EUTROPHICATION OF WATER BODIES: INSIGHTS FOR AN AGE-OLD PROBLEM,
Texas Univ.-Dallas, Richardson.
G. F. Lee, W. Rast, and R. A. Jones.
Environmental Science and Technology, Vol. 12, No. 8, p 902-908, August, 1978. 6 fig, 1 tab, 6 ref.

Descriptors: *Eutrophication, *Vollenweider models, *Nutrients, *Phosphates, *Nutrient removal, *Water pollution control, Water pollution effects, Water quality control, Phosphorus, Depth, Hydraulic residence time, Lakes, Pollutants, Point pollution, Nonpoint pollution, Great Lakes, Water pollution sources, Organization for Economic Cooperation and Development, Water management(Applied), Waste water treatment.

This report surveys the current state of information on the relationship between phosphate inputs to a water body and eutrophication-related water quality problems. Research of the past 10-15 years has established phosphorus as a key element controlling planktonic algal growth in freshwater; in marine waters nitrogen is generally the controlling factor. While past eutrophication control measures have been directed primarily toward control of phosphorus from point sources (especially domestic wastewater), it is now clear that for many water bodies phosphorus from nonpoint sources must also be controlled if acceptable water quality is to be restored. This paper includes: (1) a discussion of eutrophication processes; (2) definitions relating to lakes and lake enrichment; (3) description of the Vollenweider model for determining critical phosphorus laods to lakes (which relates areal phorphorus loading to the ratio of mean depth:hydraulic residence time; (4) identification of phosphorus sources; (5) overview of the OECD Eutrophication Study; (6) limnological measurement methods; and (7) effects of phosphours remova. Phosphorus can be reduced to a concentration of about 1 mg P/l in domestic wastewater effluent at a cost of less than $.01/person/day. Reduction of phosphorus loading can significantly decrease oxygen depletion rate and algal biomass and increase water clarity. It is well-established that for many water bodies internal phosphorus loading is small, and most bioavailable phosphorus is due to external sources. (Lynch-Wisconsin)

EFFICIENCY AND EQUITY IN PRICING LOCAL PUBLIC SERVICES: THE CASE OF WASTEWATER,
Wisconsin Univ.-Madison. Dept. of Agricultural Economics.
D. Peterson.
Available from University Microfilms International, Ann Arbor, MI 48106. Ph.D. thesis, 1977. 240 p, 12 fig, 44 tab, 116 ref, 2 append. OWRT B-087-WIS(4), 14-31-0001-4139.

Descriptors: *Cost sharing, Cost analysis, *Sewage treatment, *Waste water treatment, Management, Wisconsin, Cost-benefit analysis, *Madison Metropolitan Sewerage District(Wisc).

The Madison Metropolitan Sewerage District and the Madison, Wisconsin urbanized area were chosen for a data base to demonstrate the pricing model. The objective of the pricing model is to maximize the aggregate consumer surplus of all households which use public wastewater services subject to the constraint that the MMSD breaks even; i.e. does not incur a loss. The residential users of the district were divided into three distinct population density groups to reflect the fact that population density is a key factor in determining the cost of service. Using the household demand characteristics for wastewater services, the distribution of rental values for housing services as a proxy for wealth, the model was solved to yield a series of optimal prices for each population density group. The normative decision parameter, which explicitly sets forth the value judgments concerning household welfare, determines which price of the series best meets the values of the community. Four alternative pricing rules were compared with the optimal price series to evaluate the welfare effects. In most cases, if equity is a strong social objective, the optimal price is equal to average cost, not marginal cost. Marginal cost pricing is optimal only in the sense that equity objectives are ignored or do not matter. Even with cost pricing, however, a distinction must be made among user groups to avoid the welfare losses that result from charging a uniform price over time and space.

TRICKLE-BED REACTOR PERFORMANCE, PART 1: HOLDUP AND MASS TRANSFER EFFECTS,
California Univ., Davis. Dept. of Chemical Engineering.
S. Goto, and J. M. Smith.
AIChE Journal, Vol. 21, No. 4, July, 1975, p. 706-713. 9 fig, 1 tab, 22 ref. (California Water Resources Center Project UCAL-WRC-W-392). OWRT A-051-CAL(2).

Descriptors: *Chemical reactions, *Mass transfer, Coefficients, Trickle-bed reactors, *Gas-to-liquid transfer.

Liquid holdup and mass transfer rates were measured in a 2.58-cm I.D. tube, packed with glass beads and granular CuO:ZnO catalyst or beta-naphthol particles, and operated as a trickle bed. Gas-to-liquid (water) transport coefficients were determined from adsorption and desorption experiments with oxygen at 25C and 1 atm. Liquid-to-particle mass transfer was studied using beta-naphthol particles. Holdup and both mass transfer coefficients were unaffected by gas flow rate but increased with liquid rate. The data were correlated with equations that could be used for predicting mass transfer coefficients at high temperatures and pressures for use in the reaction studies reported in Part II. (See also W79-01566) (Snyder-Calif, Davis)

TRICKLE-BED REACTOR PERFORMANCE, PART II: REACTION STUDIES,
California Univ., Davis. Dept. o
S. Goto, and J. M. Smith.
AIChE Journal, Vol. 21, No. 4, July, 1975, p. 714-720. 11 fig, 3 tab. (California Water Resources Center Project UCAL-WRC-W-392). OWRT A-051-CAL(3).

Descriptors: *Water purification, *Oxidation, Mass transfer coefficients, Filters, *Trickle-bed reactors, *Reaction, Kinetics, Waste water treatment, Formic acid.

Dilute solutions (132 ppm) of formic acid in water were oxidized with air in a trickle-bed reactor at 212C to 240C and 40 atm. Particles 0.291 and 0.0541 cm in diameter, prepared from a commercial CuO:AnO catalyst, were used to provide a model system for studying water purification by catalytic oxidation. Differential reactor runs were made to measure the global rate of reaction. These data were compared with predicted rates from the known intrinsic kinetics and intraparticle diffusivities, and the mass transfer coefficients were measured in Part I. High conversion (of formic acid) data were also obtained in order to test models for trickle-bed reactors. Experimental conversions agreed reasonably well (within 10%) with predicted values based upon intrinsic kinetics and the several transport rates. Axial dispersion was found to be less important than gas-to-liquid mass transfer and intraparticle diffusion. In our laboratory studies (reactor I.D. = 1 in.) careful arrangements were made to obtain nearly uniform distribution of liquid over the reactor cross section. Hence effects of maldistribution, which may be important in large-scale reactors, were minimized. (See also W79-01565) (Snyder-Calif, Davis)

CATALYTIC OXIDATION OF FORMIC ACID IN WATER. INTRAPARTICLE DIFFUSION IN LIQUID-FILLED PORES,
California Univ., Davis. Dept. of Chemical Engineering.
G. Baldi, S. Goto, C.-K. Chow, and J. M. Smith.
Ind. Eng. Chem., Process Des. Develop., Vol. 13 No. 4, 1974, p 447-452. (Univ. of California Water Resources Center Project UCAL-WRC-W-392) OWRT A-051-CAL(1).

Descriptors: *Water pollutant treatment, Waste water treatment, *Oxidation, Formic acid, Diffusion, Catalytic oxidation, Porosity, Catalysts.

Liquid-phase oxidation with a solid catalyst provides a potential method for the removal of dissolved pollutants. A commercial CuO-ZnO catalyst was found to be effective for converting dilution solutions of a test pollutant, formic acid, to carbon dioxide at 200-240C. To prevent the presence of a vapor phase the operating pressure was maintained at 40 atm. Rate measurements showed the reaction to be first order with respect to both dissolved oxygen and formic acid concentrations. In the presence of formic acid solutions the catalyst could be reduced when the oxygen concentration was low and oxidized at higher oxygen concentrations. Possibly the activity of the catalyst is explained by an oxidation-reduction mechanism. Measurements with large catalyst particles (0.477 cm diameter) showed severe retardation of the rate; effectiveness factors as low as 0.11 were obtained. Tortuosity factors (approximately 1.8 were lower than would be expected for gas-filled pores. The intrinsic activation energy was about 5 kcal/mol while the apparent value for 0.477-cm particles was 24 kcal/mol. (Snyder-Calif, Davis)

VEHICLE WASHING OPERATIONS AND WASTEWATER DISCHARGES, FORT DRUM, NY -- FINDINGS AND RECOMMENDATIONS,
Construction Engineering Research Lab., Champaign, IL.
R. J. Fileccia, L. J. Benson, K. A. Conley, and J. E. Matherly.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A026 17 Price codes: A03 in paper copy, A01 in microfich Technical Report No. E-80, June 1976. 47 p, 12 fi 12 tab.

Descriptors: *Waste water treatment, *Surveys, *Costs, *Design, *Technology, Water pollution treatment, Fort Drum, New York, Army vehicle, Sedimentation, Filtration, Oily water, Oil waste

A survey was carried out of Army vehicle washing facilities, and waste water discharges resulting from these activities at Fort Drum, New York. On the basis of the survey data and information supplied by post personnel, a concept design and cost estimates were prepared for a new consolidated washrack facility to replace existing facilities. The recommended design incorporates hand-held, high pressure/low volume wash hoses for tracked vehicles and fixed nozzle drive-through facilities for wheeled tactical equipment. The proposed centralized waste water treatment system consists of a sedimentation basin equipped for mechanical free oil removal, followed by filtration through a polishing filter. (Majtenyi-IPA)

study was performed to determine if reclaiming ndry waste waters at military quartermaster ndries would be economical. Several potential atment systems were designed and evaluated, luding chemical and physical methods, such as agulation by aluminum sulfate, activated pow-ed carbon with a polyelectrolyte, and induced flotation. Usage, costs, designs, comparisons, d assumptions are described in detail and an nomic analysis was performed. It was conclud-that laundry waste water recycling is currently economical and there is no indication that pres-conditions will change dramatically enough in near future to warrant future study of laundry ctices. periments were carried out tracing the fate of benzopyrene dissolved in water and subjected ifferent kinds of treatment common to drinking er supply systems. This compound was chosen epresenting carcinogenic hydrocarbons known e part of the pollution produced by coke and e plants, oil refineries and gas works. Studies the effect of chlorine on 3,4-benzopyrene re-ed that the major products are 5-monochloro-benzopyrene which has not been studied for inogenicity and, to a lesser extent, 3,4-benzo-ene-5,8-quinone which is not carcinogenic. orine in semibound form, for example as chlo-ine, was ineffective for reducing 3,4-benzopyr-concentration. Ozonation proved more effec-than chlorination. It reduced 3,4-benzopyrene centration by a factor of 10 to 50 where chlor-ion reduced concentration only by a factor of 5 10. However, it was concluded that water not be completely freed from benzopyrene er practical conditions even after chlorination 0.5 to 2 hours or ozonation for 3 to 5 minutes. jtenyi-IPA)

GAMMA-RAY COUNTING APPARATUS R EVALUATING THE FALLOUT REMOV-EFFECTIVENESS OF REVERSE-OSMOSIS TER PURIFICATION SYSTEMS,
stic Research Labs. Aberdeen Proving und, MD.
Thomson, S. Schiller, J. Goshorn, E. Kaufman, and C. Hollandsworth.
Available from the National Technical Information Service, Springfield, VA 22161 as ADA-039 749, Price codes: A02 in paper copy, A01 in microfiche. Report No. BRL-MR-2746, May 1977. 23 p, 6 fig.

Descriptors: *Radioactive wastes, *Radioactive techniques, *Gamma rays, *Radioisotopes, *Potable water, Iodine 131, Strontium 85, Cesium 134, Reverse osmosis, Monitoring, Laboratory tests, Water quality control, Water purification, Water pollution, Evaluation, Measurement, Equipment.

A gamma ray detection system for measuring concentrations of radioactive impurities and procedures for its calibration and use are described. The system is based on scintillation methods and emphasizes counting efficiency, calibration accuracy, and a minimum of sample preparation. It is capable of dose counting water samples in the range of activities from a few tens to a few millions of picocuries per liter in a time period of 30 minutes. Tests were carried out on samples containing three important isotokpes, iodine 131, strontium 90, ad cessium 137, which were processed through a reverse osmosis system. The attenuation of activity taking place as the stream was processed was monitored with an accuracy of a fraction of 1%. The accuracy of absolute dose level determinations was limited by the errors in the calibration standards at levels of a few thousand picocuries per liter and at lower levels, statistical uncertainty is dominant. The problem of waste water treatment in chemical plants is examined with emphasis on recuperative systems whereby hazardous substances which are difficulty soluble in water may be separated and reused. Cost effectiveness is considered, but major focus is on estimation of the degree of pollutant removal based on their physical properties. As an illustrative example, calculations were done for separations using a fractioning column having only a stripping section and heated by direct steam at atmospheric pressure. Equilibrium equations and curves were established for substances, such as nitrobenzene, which form azeotropes with water. These theoretical calculations yielded the number of theoretical plates needed of successful separation as well as steam consumption so that optimum design and economic efficiency could be determined. Using this method a highly favorable recovery of nitrobenzene was predicted. This prediction was verified in laboratory studies yielding 94% recovery. However, because fractionation at lower temperatures is advantageous, other experiments used column operating pressure of about 55 mm Hg to separate a water-p-nitrotoluene system at an average column temperature of 43 C. A recovery of 99% was obtained from a 0.1% solution of p-nitrotoluene. Diagrams of two recuperative treatment plats using this system at atmospheric pressure an vacuum are included which are currently being built in Romania. (Majtensyi-IPA)

Descriptors: *Water purification, *Waste water treatment, *Ultraviolet light, *Ozone, Recycling, Mathematical models, Organic chemicals, Microorganisms, Research and development, Disinfection, Treatment facilities, Laboratory tests, Pilot plants, Spacecraft, Technology.

An ultraviolet light-ozone system for destroying organic compounds and microorganisms in waste water suitable for use in the Army MUST Program and NASA Manned Spcecraft is described. Both laboratory tests and mathematical models were used in developing bench scale and pilot-plant scale systems. The organics of special interest were hydroquinone, pyrogallol, xylenol, urea, and sodium, acetate. Ethanol, glycerol, glycine, and acetic acid were evaluated also. The UV-ozone process was found to be more effective than either UV or ozone alone in destroying organics and microorganisms in various waters. Studies, using mathematical models, indicated that a Unit Reactor Module of 5 KW power for treating hospital composite, reverse osmosis permeate will occupy 5-ft 6-in by 2-ft 6-in and will weigh 750 lbs. This will include 36-inch UV lamps and operate at 3 to 5 psig pressure. The UV-ozone system for manned spacecraft capable of accomodating a crew of five would be 7-in by 8-in, weigh 12 lbs, and consume 36 Whrs/lb water. Detailed evaluations of equipment performance and capabilities are included and recommendations are made of further research, both chemical and mathematical. (Mjtenyi-IPA)

CLEAN UP MIXED WASTE STREAMS -- THE TANK TRUCK WASHING EXAMPLE.
MITRE Corp., McLean, VA. METREK Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-267 557, Price codes: A02 in paper copy, A01 in microfiche. Report EPA-600/9-77-007, and M77-2, April 1977. 10 p, 1 fig, 6 tab. 68-01-3188.

Descriptors: *Industrial wastes, *Waste water treatment, *Technology, *Water pollution control, *Tank trucks, Coagulation, Aeration, Filtration, Costs, Swedesboro, New Jersey, Water pollution, Separation techniques, Flotation, Hydrogen ion concentration, Sedimentation, Cost analysis.

A system of treating waste waters produced by the cleaning of tank trucks was developed and tested at the Swedesboro, New Jersey, terminal of Matlack Corp. Although tank truck cleaning produces only small quantities of waste water, the wide range of cargoes carried results in a high degree of variability in pollutional content as indicated by a table showing 21 tanker cargoes. To deal with such wide ranging pollutants, the system uses seven separate operations: oil separation, air flotation, chemical coagulation and pH adjustment, equilibration/sedimentation, mixed media filtration, carbon adsorption, and rotating filter-biofiltration. Each of these steps is described briefly and preliminary effluent data is tabulated. Cost of operating the system is about $50 per 1000 gallons or $750 a day. It is concluded that this system is effective for treating waste waters from tanker

cleaning that now go to municipal waste streams and may have applicability in a broad range of chemicals manufacturing industries. (Majtenyi-IPA)

TECHNICAL-ECONOMICAL SOLUTION TO THE PROBLEM OF EFFLUENTS IN AN INTEGRATED PAPER MILL (SOLUCION TECNICO-ECONOMICA DEL PROBLEMA DEL EFLUENTE EN UNA PLANT PAPELERA INTEGRADA EN OPERACION),
H. A. Del Roscio, and M. Davidovsky.
ATIPCA (Asociacion de Tecnicos de la Industria Papelera y Celulosica Argentina), Vol. 16, No. 4, p 45-56, 58-59, 1977. 1 appendix, 3 fig, 8 tab.

Descriptors: *Pulp and paper industry, *Waste water treatment, *Argentina, Water pollution treatment, Water pollution source, Wastes, Industrial wastes, Waste treatment, Pulp wastes, Effluents, Sedimentation, Aerated lagoons, Activated sludge, Foreign countries, South America, Costs, Capital costs, Operating costs, Groundwood mills, Printing paper, Writing paper, Corrugating medium(Fluting paper), Soda pulp mills, Bleached pulp mills, Chemical recovery.

A study is presented on effluent treatment possibilities at Celulosa Argentina SA. (Argentina), an integrated mill producing 130 tons/day of bleached and unbleached mechanical pulp, 130 tons/day of bleached and unbleached cold-soda pulp, and 300 tons/day of printing and writing papers and corrugating medium. Options considered included sedimentation and aeration lagooning of all effluents jointly (base alternative) and three alternatives associated with internal recovery of bark, mechanical pulp rejects, and fibers and fillers in papermaking, viz., separate secondary treatment of soda pulping effluents with the remainder of the effluents passing only through primary treatment (A), activated sludge treatment exclusively for the soda pulping effluents (B), and dilution of the soda pulping effluents coupled with primary treatment of the other effluents and mixing of the two streams (C). While alternatives A and B were immediately ruled out on the basis of space requirements of capital investiment needs, capital and operating costs were worked out in detail for the base alternative and for alternative C. Alternative C is shown to involve relatively low investment and operating costs and the latter are substantially offset by the internal recovery of materials. (Spckhard-IPC)

Multidisk filters, used for fiber recovery at paper mills, can be operated with a fibrous layer to recover all fiber fractions, or without the fibrous layer to serve as fractionators. Such filters have been installed at many Soviet paper mills in recent years. The specifications of these filters are tabulated, and a description is given of the installation, operation, and efficiency of the filters at Segezh and Svetogorsk mills (Eimco filters), Zhidachev mill (Fampa FS filters), and the Klaipeda boad mill (Jones filters). All these filters perform well and give a fiver recoveryof up to 95-97% and filler recovery of up to 92-93%. The filters can be used for any fiber-containing effluent, but they are most efficient for recovering fibers in white water from the manufacture of papers of low filler content. In all mills equipped with the filters the recovered fibers are reused and the clarified white water is recycle. For this reason their use for joint purification of white water and other paper mill effluents is not recommended. (Stapinski-IPC)

The wet process developed by Defibrator AB. (Sweden) for the production of fiberboard gives a product with good quality, but the effluents generated result in environmental damage if is discharged directly into a recipient stream. Either an effluent treatment plant is constructed and operated at rather high costs, or an attempt is made to separate the organic materials from the effluent and use them as fodder material. A third alternative includes closing of water circuits in the plant resulting in zero discharge. While the treatment plant construction and operation results in substantially reduces return on investment, the third alternative has very little economic impact. The second alternative did not reach commercialization, because organics could be separated only partially from the effluent. It is concluded that whenever environmetal protection is mandated by law, the closing of water circuits presents an economically more advantageous alternative compared to construction and operation of an effluent treatment plant. A flotation process, of use, for example, in treating papermaking effluents is designed to form in a bath bubbles having a diameter of less than 100 micrometers without producing currents which would break up flocks or unstable particle agglomerates. Specifically, an emulsion ofair in water, formed in known manner as a jet within the flotation bath, is deflected with an associated jet of water over a curved path within the bath such that the bubbles migrate from the emulsion jet to the water jet, from where they ascend through the bath. DECOLORING OF WATER-SOLUBLE AZO DYES BY OZONE (IN JAPANESE),
Gifu Univ. (Japan).
M. Matsui, Y. Satoh, K. Shibata, and Y. Takase.
Journal of the Society of Fiber Science and Technology Japan (Sen-i Gakkaishi), Vol. 34, No. 4, p T181-T186, April, 1978. 10 fig, 12 ref, 3 tab. English summary.

Descriptors: *Dyes, *Ozone, *Decoloring, *Waste water treatment, Wastes, Industrial wastes, Water pollution sources, Waste treatment, Water pollution treatment, Organic compounds, Color, Degradation(Decomposition), Chemical degradation, Azo dyes.

The reaction of ozone with the water-soluble azo dye C.I. Acid Orange 12 is of a pseudo first-order. It involves mainly attack on the N=N bonds in mono-azo dyes and cleavage of the aromatic rings to yield carboxylic acids. The decomposition involves intermediates containing active oxygen atoms. The reaction is accelerated by dissociation of OH groups in the dye molecule and by self-decomposition of ozone. (Brown-IPC)

CHARACTERIZATION OF VARIOUS CONDENSATE STREAMS IN THE KRAFT PROCESS,
National Council of the Paper Industry for Air and Stream Improvement Inc., New York.
M. E. Franklin.
NCASI Stream Improvement Technical Bulletin, No. 310, 33 p, April, 1978. 1 appendix, 15 fig, 1 illus, 10 tab.

Descriptors: *Pulp wastes, *Condensates, *Kraft mills, *Waste water treatment, Wastes, Industrial wastes, Water pollution sources, Pulp and paper industry, Effluents, Evaporation, Biochemical oxygen demand, Alcohols, Evaporators, Waste treatment, Water pollution treatment, Water pollution control, Methanol, Black liquor.

This study carried out by the NCASI West Coast Regional Center showed that methanol contributes about 35% of the BOD present in kraft mill condensates from multiple-effect black liquor evaporators. The sequence in which weak liquor is introduced to evaporators was shown to affect the distribution of BOD in the condensate streams from individual evaporator effects. To concentrate the bulk of the BOD in the smallest volume of condensate, weak liquor feed to the last stream effect was found to be most effective. Introduction of weak liquor at a point further down the evaporation step distributes the same amount of BOD into a larger condensate volume. The study also confirmed that digester condensates and turpentine decanter underflow streams are logical candidates for internal process load reduction schemes such as reuse or selective treatment. The possible utilization of condensates from digester relief and black liquor evaporators and the resulting reduction of freshwater demand have been discussed in an earlier report. This article deals with the content of impurities in the condensates and with the elimination of volatile impurities by air or steam stripping. Condensates from digester relief gases and from a multiple-effect evaporator were analyzed for their COD, methanol, dry solids, sulfur, and sulfides contents, and samples of these condensates were treated with air and steam in a Vigreux column connected to two condensers. Considerable differences were found in the concentrations of individual impurities at various production points. Thus, the condensates should

ollected and treated separately for maximum puri-cation efficiency. For example, the concentration methanol was high in digester relief condensates id accounted for up to 80% of their COD. When erated under optimum conditions (air volume 60 nes that of condensate), the purification efficien- was 11% when condensates at 70C were treated ith air, about 35% when the temperature was 0C, and about 70% when steam was used for eatment. new broad-spectrum effluent treatment process, ginally developed as a treatment method for tal-complexed cyanide wastes from the electro-ting and photographic processing industries, has ently been introduced to the European market. e to the energy input from UV radiation, the ilable oxidation energy per molecule of ozone is reased by up to 35%. This is due to the en-cement of the reaction between ozone and ter to form hydroxyl radicals, which have a her oxidation potential (2.80 volts) than ozone 7 volts). Additionally a portion of the UV iation can excite the contaminant species to der it more susceptible to oxidation. The proc-also destroys chlorinated organics and organic phosphorus pesticides such as malathion. The photolysis process compares favorably with tment using ozone alone in decoloring un-ched kraft mill effluent. Treatment of a kraft effluent stream of 1,000,000 gal/day would uire an ozone dosage of 5,000 lb/day when g ozone alone; under Oxyphotolysis, the age would be only 1,350 lb/day. (Witt-IPC)

criptors: *Livestock, *Waste treatment, *Eco-ics, Aerobic conditions, Anaerobic conditions, erobic conditions, *Farm wastes, *Germany.

The livestock industry is confronted more and more with problems of environmetal protection linked to costs threatening its competitiveness. The aims of manure treatment regarding odors, pathogens and volume reduction by clarification are considered. Agricultural use of manure appears to be the most economical method. For biological degradation of manure, two detchniques are presented. Anaerobic decompostion yields strong smelling decay products and depends mostly on outside temperatures. In aerobic decomposition few or no offensive smells are created because of the aerobic bacteria. Aerobic degradation is suitable for different types of manure, proceeds quickly and develops its own heat. The aerobic operations of oxidation ditches, oxidation silos, forced-air systems, and their possible improvement are discussed. Composting also involves aerobic biological degradation and is more desirable hygienically. However its marketability is limited by lack of effective cost defrayments. (Solid Waste Information Retrieval System).

TREATMENT OF BLEACH PLANT EFFLUENTS BY COMBINED REVERSE OSMOSIS AND FREEZE CONCENTRATION PROCESS,
Institute of Paper Chemistry, Appleton, WI.
A. J. Wiley, L. E. Dambruch, P. E. Parker, and H. S. Dugal.
Presented at TAPPI Environmental Conference, Washington, DC., April 12-14, 1978, Preprinted Proceedings (TAPPI, Atlanta, Georgia 30338), p 63-70. 5 fig, 9 ref, 10 tab.

Descriptors: *Bleaching wastes, *Waste water treatment, *Reverse osmosis, *Freeze concentration, Wastes, Industrial wastes, Pulp wastes, Sulfite liquors, Water pollution treatment, Water pollution sources, Osmosis, Membrane processes, Membranes, Pulp and paper industry, Water conservation, Water reuse, Recycling, Capital costs, Operating costs, Costs, Pilot plants, Waste treatment, Cellulose acetate, Sulfite pulp mills, Kraft mills.

Bleach plant effluents containing 0.5% solids are concentrated to 5% solids by reverse osmosis in pilot-plant studies conducted by the Institute of Paper Chemistry (Appleton, Wisconsin) at the calcium-base sulfite mill of Flambeau Paper Co. (Park Falls, Wisconsin) and at kraft mills of the Continental Group (Augusta, Georgia) and Chesapeake Corp. (West Point, Virginia). The first freeze concentration (F.C.) stage concentrates the effluent from 5 to 15% which in turn is concentrated to 25% by the second F.C. stage. Approximately 97-98% of the effluent can be recovered as high-quality water that could be recycled to the pulp mill. The Concentrate from the F.C. process, i.e., 2-3% of the effluent flow, contains 90-95% of the total solids and 100% of the total color. At current levels of water consumption in the bleach plant, operating costs are $20-30/ton of bleached pulp (about $2.50/1000 gal of effluent) and capital costs are about $30,000/daily ton of bleached pulp. Reducing water consumption from 10,000 to 5,000 gal/ton would reduce operating charges to the $12-15/ton range and reduce capital costs to about $16,000/daily ton of production. If cellulose acetate reverse osmosis membrane suppliers could double or triple the expected membrane life, operating costs would drop to a competitive level. The reverse osmosis/F.C. process can be readily piped to an existing system, and extensive renovation is not required. (Swichtenberg-IPC)

Descriptors: *Pulp wastes, Bleaching wastes, *Waste water treatment, *Membrane processes, Wastes, Industrial wastes, Water pollution sources, Pulp and paper industry, Membranes, Color, Separation techniques, Reverse osmosis, Costs, Economics, Biochemical oxygen demand, Dissolved solids, Organic compounds, Carbon, Sodium compounds, Operation and maintenance, Pilot plants, Florida, Osmosis, Waste treatment, Computer programs, Cellulose acetate, Polysulfone, Ultrafiltration, Decoloring, Kraft mills.

Ultrafiltration and reverse osmosis processes using polysulfone and cellulose acetate membranes, respectively, were evaluated for their application in purifying effluent from a pulp mill screen room and for removal of color from caustic bleach plant effluent. The tests were done in a tubular-membrane pilot plant in Florida. Graphical and tabular data are presented to show the effects of operating pressure, velocity, and solids concentration on flux and rejection of contaminants, viz., color, total organic carbon, BOD, total dissolved solids, and sodium. A computer program was designed to predict the steady-state concentration of contaminants, optimum operating conditions, and costs for membrane systems. Examples are presented of how membranes might be used in a kraft mill and the resulting rejections of color and other contaminants in the mill effluent. Pilot-plant results indicate that in-plant color removal by membranes is competitive with the costs of external treatment methods. (Swichtenberg-IPC)

SUCCESSFUL MEAD (CORPORATION) PROGRAM TO REDUCE EFFLUENT VOLUME,
Mead Corp., Kingsport, TN.
R. W. Self, and K. C. Ayers.
Presented at TAPPI Environmental Conference, Washington, D.C., April 12-14, 1978, Preprinted Proceedings (TAPPI, Atlanta, Georgia 30338), p 83-87. 1 ref, 2 tab.

Descriptors: *Pulp wastes, *Sludge, *Water pollution control, Waste water treatment, Wastes, Industrial wastes, Water pollution sources, Water pollution treatment, Tennessee, Biochemical oxygen, Suspended solids, Effluents, Pulp and paper industry, Recycling, Water reuse, White water(Paper machines), Soda pulp mills, Fine-paper mills.

Raw waste loads to the primary and secondary (aerated stabilization basin) effluent treatment facilities were reduced from an average 16,500,000 gal/day in 1975 to 12,300,000 gal/day in late 1977 by an in-plant program conducted at a bleached soda pulp and fine-paper mill in Kingsport, Tennessee. The BOD (lb/day) of the raw waste load decreased while the concentration increased slightly. The decrease in the lb/day of total suspended solids was significant while the concentration was

also decreased slightly. In-plant projects to reduce effluent volume included recycling the white water from the high-speed fine-paper machine to the freshwater treatment plant; the development of a cooling-water system; use of excess clarified white water for stock dilution at the pulper, high-density fiber storage tank, and brown stock decker; and air purging of coating color on on-machine coaters during paper grade changes. (Swichtenberg-IPC)

COMPONENTS OF A SUCCESSFUL IN-MILL CLOSE UP PROGRAM,
Consolidated Papers, Inc., Whiting, WI.
D. J. Czappa.
Presented at TAPPI Environmental Conference, Washington, D.C., April 12-14, 1978, Preprinted Proceedings (TAPPI, Atlanta, Georgia 30338), p 89-99. 6 fig, 5 tab.

Descriptors: *Pulp and paper industry, *Water conservation, Water reuse, Water pollution control, Wastes, Industrial wastes, Water pollution sources, Wisconsin, Industrial water, Suspended solids, Biochemical oxygen demand, Pulp wastes, Activated sludge, Groundwood mills, Printing paper, White water(Paper machines).

In-mill close-up procedures implemented during the period from 1974 to 1977 at the Wisconsin River Division of Consolidated Papers, Inc. (Whiting, Wisconsin) were largely responsible for the success of the activated sludge effluent treatment plant. Suspended solids and 5-day BOD discharges amounted to 8.5 and 10 ppm or 10 and 20% of the allowed Best Practical Technology (BPT) discharge limits (July 1977), respectively. Water consumption at the groundwood pulp and lightweight coated printing paper mill was reduced from 4,100,000 to 2,900,000 gal/day. Modifications in the collection and reuse systems are described for heavy and clarified white water, press section water, vacuum pump seal water, hot water, and groundwood white water. (Swichtenberg-IPC)

The semichemical corrugating medium and kraft linerboard mill of Continental Forest Industries decided to meet 1977 effluent treatment requirements by participating in a large regional treatment plant and interceptor system operated by the City of Hopewell, Virginia. Accidental spills of concentrated chemicals in the brown stock washer, evaporator, recovery furnace, and causticizing areas were identified as a potential threat to the regional plant. A spill containment and effluent management system was established within the mill to reduce the frequency and impact of spills. Major design considerations for the system are described. OPERATING EXPERIENCES AT LONGVIEW FIBRE COMPANY'S PURE OXYGEN ACTIVATED SLUDGE SYSTEM,
CH2M/Hill, Corvallis, OR. Industrial Processes Div
G. Peterson, J. Klein, and D. Martinsen.
Presented at TAPPI Environmental Conference, Washington, D.C., April 12-14, 1978, Preprinted Proceedings (TAPPI, Atlanta, Georgia 30338), p 139-147. 6 fig, 2 tab.

Descriptors: *Pulp wastes, *Waste water treatment, *Activated sludge, *Operation and maintenance, *Washington, Wastes, Industrial wastes, Waste treatment, Water pollution treatment, Water pollution sources, Pulp and paper mills, Sulfite liquors, Oxygen, Sludge, Sludge treatment, Dewatering, Biochemical oxygen demand, Suspended solids, Effluents, Spills, Condensates, Kraft mills, Sulfite pulp mills.

Highlights of a 10-year program to reduce the volume and pollutant levels of effluent at a kraft (bleached and unbleached) and neutral sulfite semichemical (NSSC) mill in Washington include in-mill projects (viz., conversion of brown stock washing lines from 3 to 4 stages, steam stripping of digester and evaporator foul condensates, and collection and containment of pulp mill liquor spills), startup of a UNOX activated sludge treatment plant, and the purchase of two belt presses for sludge dewatering. Operating characteristics and problems are discussed for both the UNOX process and sludge-dewatering presses. Average effluent discharge levels for 5-day BOD and total suspended solids are 5,700 and 23,200 lb/day, respectively. (Swichtenberg-IPC)

DESIGN AND OPERATION OF GREAT NORTHERN PAPER COMPANY'S SECONDARY TREATMENT FACILITIES AT EAST MILLINOCKET, MAINE,
Jordan (Edward C.) Co., Inc., Portland, ME.
A. J. Condren, and P. H. Welch.
Presented at TAPPI Environmental Conference, Washington, D.C., April 12-14, 1978, Preprinted Proceedings (TAPPI, Atlanta, Georgia 30338), p 149-156. 4 fig, 6 tab.

Descriptors: *Pulp wastes, *Waste water treatment, *Treatment facilities, *Maine, Wastes, Industrial wastes, Waste treatment, Water pollution treatment, Water pollution souces, Pulp and paper industry, Aerated lagoons, Biochemical oxygen demand, Suspended solids, Nutrients, Neutralization, Sludge treatment, Dewatering, Operation and maintenance, Effluents, Newsprint mills.

Startup of the secondary effluent treatment system (an aeration basin with a retention time of 31 hr) occurred on October 1, 1976 at Great Northern Paper Co.'s 1000-ton/day newsprint mill in East Millinocket, Maine. Upon obtaining proper operational parameter control, the system has yielded an effluent of a quality superior to the average allowable discharge, i.e., 7,700 lb 5-day BOD/day and 6,800 lb total suspended solids/day. Data are presented depicting the statistical reliability of the system for 5-day BOD and total suspended solids removal, the nutrient and neutralization requirements, the secondary solids generation, and the secondary sludge dewatering system performance. In addition, operational problems encountered and corrective actions taken are addressed. (Swichtenberg-IPC)

THE RELATIONSHIP OF BIOLOGICAL POPULATION TO ACTIVATED SLUDGE PLANT PERFORMANCE,
Westvaco Corp., Covington, VA.
C. T. Bell.
Presented at TAPPI Environmental Conference, Washington, D.C., April 12-14, 1978, Preprinted Proceedings (TAPPI, Atlanta, Georgia 30338), p 171-187. 5 fig, 17 illus, 3 ref.

Descriptors: *Activated sludge, *Pulp wastes, *Waste water treatment, *Biological communities, Wastes, Industrial wastes, Water pollution treatment, Waste treatment, Pulp and paper industry, Water pollution sources, Temperature, Hydrogen ion cooncentration, Dissolved oxygen, Toxicity, Virginia, Performance, Treatment facilities, Aerated lagoons.

Laboratory studies showed that the acclimated biological population retained in an aeration by suspension cannot tolerate erratic changes in temperature, pH, dissolved oxygen level, and toxicity. A temperature over 103F had a significant influence on the bactericidal effects of cooking liquor and dispersed rosin sizing. Since 1970 the operating efficiency at the activated sludge treatment plant of Westvaco Corp. (Covington, Virginia) has been reliably predicted by microscopic examination of the aeration bay suspension. Instantaneous information can be obtained regarding the health status of the overall biological population, the characteristics of floc formation, and the content of nonbiologically degradable materials. Points of origin of pollutants and wastes in pulp and paper production are reviewed, and problems involved in the utilization of slash and other forest residues are discussed. The prospects of new low-pollution pulping and bleaching processes are analyzed. By 1985 several new principles will be in operation at pulp mills, notably ecology-conscious utilization of al forest and agricultural residues; more compact pulp-manufacturing units with minimizied air pollution in the immediate mill vicinity; and dimensional reduction or elimination of large storage areas and waste-treatment facilities. Cooperative efforts required to reach this stage are specified. (Brown-IPC)

PROCESS AND APPARATUS TO TREAT PUTREFACTIVE WASTE FROM RAW FISH AND MEAT.
Belgian Patent BE-842-053. Issued September 16, 1976. Derwent Belgian Patents Report, K(41):03, November 17, 1976.

Descriptors: *Dewatering, *Waste water treatment, *Waste disposal, Energy conversion, Heat treatment, Fertilizer, *Meat processing wastes.

A process and apparatus to treat putrefactive waste from raw fish and meat was patented. It can treat such material rapidly without causing odor. The waste from domestic or industrial kitchens moves between grinding rollers and into a chute, then to an endless screw type grinder. Solids are separated and move through dehydrating rollers to an ultraviolet sterilizing chamber; they are dried by hot air in a perforated drum on their way to a receptacle. The separated liquid flows to a stirrer where a deodorizing liquid is added to the mixture, goes to a header tank, and then to a concentrating tank where the pressure is reduced. Oil and water are separated by centrifugation and flow to separate reservoirs. The by-products may be used as fertilizer or animal feed. The oil recovered can be burned as fuel; the water can be further purified. (EPA-Corvallis)

KANAWHA RIVER INVESTIGATION OF WATER QUALITY AND WATER POLLUTION CONTROL PRACTICES. VOLUME II: REPORTS OF INDUSTRIAL INVESTIGATIONS ON SEVEN INDUSTRIES.
Environmental Protection Agency, Washington, D.C. Office of General Counsel.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-259 499, Price codes: A11 in paper copy, A01 in microfiche. July 1973. 226 p, 31 fig, 34 tab.

Descriptors: *Water pollution, *Industrial wastes, *Waste water treatment, *Kanawha River, West Virginia, Surveys, Effluents, Industrial plants, Pollutants, Waste disposal, Water quality control, Monitoring, Water usage, Sampling, Evaluation, On-site tests, On-site investigations, Rivers, Water pollution treatment.

The industrial treatment of waste waters discharged into the Kanawha River in West Virginia was investigated to determine if treatment is adequate and, if not, to ascertain what waste reductions are necessary to attain water quality standards. Studies were carried out by four industrial firms on seven industrial plants in the area. Each of the four, E. I. du Pont de Nemours, Union Carbide, FMC, and Monsanto, reported separately on their investigations. Each report describes plants and the wastes produced, existing waste treatment facilities, and waste water disposal. Specific data are supplied for each plant surveyed, including such information as discharges, sources, and flows of particular chemical pollutants, levels of biochemical oxygen demand loading, and comparisons of field studies carried out by Environmental Protection Agency laboratories with those done by the industrial laboratories. Also discussed are monitoring programs, spill potential, and future plans of the individual plants investigated. (Majtenyi-IPA)

ORGANIC IMPURITIES FROM INDUSTRIAL WASTE WATER REMOVAL - BY TREATMENT WITH ACTIVATED CARBON CONTAINING MANGANESE OXIDE(S) USEFUL IN CHEMICAL INDUSTRY.
Soviet Patent SU-494-929. Issued November 29, 1977. Derwent Soviet Inventions Illustrated, Vol. A, No. 34, p 2, October, 1978.

Descriptors: *Patents, *Activated carbon, *Manganese, *Adsorption, *Industrial wastes, *Dyes, Heat treatment, Chemical wastes, Temperature, Ammonium compounds, Waste water treatment, Organic compounds, Chemical oxygen demand.

A patent has been granted for an adsorption process to treat aniline-bearing wastes from a dye works, wastes containing surfactants and dyes from an alkali plant, or municipal sewage having a high COD. Granular activated carbon containing manganese oxides in an amount of 3-6% by weight is employed as the adsorbent. In an example cited, the adsorbent was prepared by impregnating activated carbon with a 3-10% aqueous solution of manganese nitrate or sulfate, followed by air drying at 150-170C. The manganese-bearing carbon was then treated with a 6-12% ammonia solution, air heated to 250-280C, and rinsed until the Mn content of the washwater was less than 1 mg/liter. Columns of activated carbon bearing 3.5, 3.0, and 5.0% Mn were employed with the alkali, aniline, and sewage wastes, respectively; corresponding treatment efficiencies of 95.2-98.5%, 96.0-99.0%, and 92.5-96.0% were obtained. Regeneration of the adsorbent by passing a stream of air through the column at 250-280C instead of the 500-800C generally used substantially reduced losses during regeneration from the 5-10% normally obtained to 1.1-2.9%. METHOD FOR ADENOSINE 5'-TRIPHOSPHATE MEASUREMENT ON COKE WASTE ACTIVATED SLUDGE,
Alabama Univ. in Birmingham, Dept. of Biology.
J. Russell, and J. J. Gauthier.
Applied and Environmental Microbiology, Vol 35, No 2, p 450-452, Feb., 1978. 2 tab, 18 ref. OWRT A-060-ALA(1).

Descriptors: *Coke waste activated sludge, Inhibitors, *Activated sludge, *Adenosine 5'-triphosphate, Measurement, Waste water treatment, Waste identification, Sodium dodecyl sulfate.

Measurement of adenosine 5'-triphosphate (ATP) in coke waste activated sludge can provide a simple method for estimating the levels of viable microbes in the sludge. However, the presence of inhibitors such as phenol in the sludge interferes when the luciferin-luciferase method is used to measure ATP. These inhibiting substances can be removed from the sludge before extraction of ATP by washing the cells with dilute sodium dodecyl sulfate.

Descriptors: *Textiles, *Chemical precipitation, *Reverse osmosis, *Polymers, *Surfactants, Membrane processes, Solubility, Organic wastes, Separation techniques, Biological treatment, Waste water treatment, Industrial wastes.

General problems in eliminating organic components from waste waters generated in textile finishing processes are discussed with special regard to precipitation and reverse osmosis. The precipitation of water-soluble polymers decreases with an increase in polymer concentration in the influent. Although nonionic surfactants cannot be effectively precipitated by means of organic and inorganic agents, surfactant-bearing solutions can be concentrated by reverse osmosis with cellulose acetate membranes. Starch-based sizings can be eliminated directly by biological treatment; sizings based on poly(vinyl alcohol) or carboxymethyl-cellulose may require additional conditioning before biodegradation. Starches, polyacrylates, poly(vinyl alcohol), and carboxymethylcellulose can also be precipitated with iron salts. (Takacs-FIRL)

OPTIMIZE THE EFFLUENT SYSTEM. PART 6: BIOCHEMISTRY OF ACTIVATED SLUDGE PROCESS.
Standard Oil Co. (Indiana), Chicago, IL.
J. F. Grutsch, and R. C. Mallatt.
Hydrocarbon Processing, Vol. 55, No. 8, p 137-142, August, 1976. 7 fig, 2 tab, 15 ref.

Descriptors: *Activated sludge, *Waste water treatment, *Enzymes, *Biochemistry, *Bacteria, Chemical reactions, Microorganisms, Biological treatment, Solid waste, Liquid wastes, Solubility, Suspended solids, Colloid, Performance, Optimization, *Biochemistry.

The biochemistry of activated sludge treatment is discussed, with particular emphasis on the role of enzyme reactions and the transport of substrate through the bacterial cell wall and membrane. Exoenzymes are needed to hydrolyze colloidal and suspended solids into smaller soluble molecules that can pass through cell membranes for food. However, these enzymes may be dispersed and lost in the effluent or destroyed by exposure to changes in pH, salinity, and other conditions. Endoenzymes on the other hand are at least partially protected from these environmental changes by the bacterial cell wall and membrane; thus, using the biological process for the removal of only soluble contaminants is consistent with obtaining a stable system. Moreover, activated sludge units that utlize only soluble contaminants can be operated at very high sludge ages, thus permitting much higher biological cell inventories which in turn increases stability, capacity, and purification while minimizing the generation of excess biological cells. BIODEGRADATION OF PHENOLIC WASTE LIQUORS IN STIRRED-TANK, PACKED-BED, AND FLUIDIZED-BED BIOREACTORS,
Oak Ridge National Lab., TN.
D. W. Holladay, C. W. Hancher, C. D. Scott, and D. D. Chilcote.
Journal Water Pollution Control Federation, Vol. 50, No. 11, p 2573-2589, November, 1978. 6 fig, 8 tab, 19 ref.

Descriptors: *Biodegradation, *Phenols, *Chemical wastes, *Biological treatment, *Industrial wastes, *Packed beds, Filters, Pilot plants, Microorganisms, Coals, Waste water treatment.

A continuously-stirred tank bioreactor (CTSBR), a three-phase (air, liquid, and bacteria-coated media) packed-bed bioreactor (PBBR), and a three-phase, fluidized bed bioreactor (FBBR) were tested for the biodegradation of phenolic waste liquors from coal processing. The phenol degradation rates achieved by the three reactors were quantified according to a formula incorporating the volumetric flow rate, the feed and effluent phenol concentrations, and the effective reactor volume. The maximum phenol degradation rates achieved at a feed concentration of 500 mg phenol/liter and 0.99 conversion were 1.0, 4.7, and 8.5 g phenol/day/liter of bioreactor volume for the CSTBR, PBBR, and FBBR, respectively. Normal effluent phenol concentrations at maximum conversion were 0.25-1.00, 0.25-1.00, and 0.01-0.50 mg/liter for CSTBR, PBBR, and FBBR operation, respectively. Preliminary results indicated that the FBBR would also be effective in oxidizing thiocyanates at lower flow rates than the maximum rates attainable for effective phenol degradation. (Schulz-FIRL)

REFINERY CYANIDES: A REGULATORY DILEMMA,
Air Products and Chemicals, Inc., Allentown, PA.
R. G. Kunz, J. P. Casey, and J. E. Huff.
Hydrocarbon Processing, Vol 57, No 10, Section 1, p 98-106, October, 1978. 4 fig, 2 tab, 101 ref.

Descriptors: *Nitrogen compounds, *Oil industry, *Analytical techniques, *Industrial wastes, Toxicity, Oil wastes, Chemical wastes, Iron compounds, Corrosion, Waste water treatment.

Cyanides in petroleum refinery effluent can be in free, simple, or complexed forms which vary in toxicity to aquatic life. Simple cyanides may form complexes with metals in petroleum waste water and induce corrosion in coolers, condenser shells, and strippers; polysulfides have been used to inhibit corrosion in some catalytic cracking systems. Research on analytical techniques for cyanides in refinery effluents has focused on devising methods to differentiate between simple and complexed cyanides and to eliminate interference by thiocyanate with cyanide concentrations below 1 mg/liter; the modified Roberts/Jackson method to measure small amounts of cyanide in the presence of ferrocyanide is described. Methods which have been used to remove cyanides from refinery effluents include chemical oxidation, biological treatment, adsorption and catalytic oxidation, and precipitation. (Schultz-FIRL)

THE REMOVAL OF ARSENIC(V) FROM ACIDIC SOLUTIONS,
Waste Research Univ, Oxon (England). Harwell Lab.
C. J. Jones, B. C. Hudson, and P. J. McGugan.
Journal of Hazardous Materials, Vol. 2, No. 4, 333-345, 1977/1978. 9 fig, 4 tab, 2 ref.

Descriptors: *Arsenic, *Metals, *Chemical precipitation, *Lime, *Iron compounds, Magnesium hydroxide, Dolomite, Leaching, Heavy metals, Industrial wastes, Sludge disposal, Waste water treatment.

Treatment with iron salts and alkaline earth me compounds has been used for effluents from el trolytic copper reclamation. Experiments to est lish the treatment efficiency for these effluer employed model solutions of As2O5 in 1.5 H2SO4 solutions which were treated with vari combinations of ferric sulfate, ferrous sulfate, lir magnesium hydroxide, and dolomite. Followi treatment, the solids were removed by centrifu tion and the supernatant was analyzed arsenic(V). Triangular diagrams outlined compo tion ranges for the treated liquors of 0.2-1.2 arsenic, 1.0-4.0% iron, and 3.0-6.5% alkaline ea metal. Treatment with ferrous sulfate plus lime v the most effective configuration, achieving 99.9 arsenic removal and residual concentrations about 5 ppm. Treatment with ferric sulfate p lime was less effective than with ferric sulfi lime, and magnesium hydroxide. The optimum p ticle size range for lime in ferrous-lime treatm was determined to be 50-100 microns. Ferric fate plus dolomite was fairly ineffective in rem ing arsenic from the solutions studied. Leach tests on arsenic-bearing sludge from the ferr sulfate-lime process in sand, clay, and chalk disp sions demonstrated that arsenic levels in leachi would be less than 1.0 ppm and generally less t 0.05 ppm; this suggested that the arsenic-bear sludges would be suitable for land disposal with posing a hazard to drinking water suppl (Schulz-FIRL)

USE OF CONTINUOUS ION EXCHANGE REMOVAL OF ENVIRONMENTAL C TAMINANTS FROM WASTE STREAMS,
Bradford Univ., (England), School of Chem Engineering.
M. J. Slater, B. H. Lucas, and G. M. Ritcey.
CIM Bulletin, Vol. 71, No. 796, p 117-123, Au 1978. 8 fig, 6 tab, 11 ref, 1 append.

Descriptors: *Ion exchange, *Acid mine w *Resins, *Separation techniques, *Heavy m Copper, Iron, Nickel, Sodium, Cobalt, Mine d age, Acidity, Voids, Mass transfer, Mine wa Waste water treatment, Industrial wastes.

tic and continuous flow tests in a tapered, fluid-ed-bed ion-exchange column defined the optim conditions for removal of heavy metals, espelly copper, from acid mine water. The pilot nt included: a 96-inch column with a 6-inch are base and an 8-inch square flared top, fed h a strong acid resin, Amberlite 200 C in the lium form; a 60-inch regeneration column, fed h a saturated NaCl solution; and a wash umn. A synthetic sulfate mine water used in the ts contained 56 ppm Cu, 3.5 ppm Ni, 0.3 ppm , 1 ppm Fe, and 20 ppm Ca, at 4.0. Static tests re performed to obtain breakthrough curves, icating that a copper loading of 0.030 g of Cu/ of wet settled resin was accommodated. Voiges were varied over 0.50-0.80 and expanded heights of 134-215 cm were tested. A voidage 0.7 and a bed height of roughly 214 cm were cted for continuous flow tests at a liquid velocof 1.22 cm/sec; NaCl loss from the 24-inch h column was reduced by doubling the column gth. The fluidized-bed extraction reduced efflumetal concentrations to <0.02 ppm Cu, <0.03 n Ni, <0.04 ppm Co, <0.03 ppm Fe, and .04 ppm Ca. Three column configurations were eloped for treating 650 Imperial gal/min of e water with a waste strength similar to that of synthetic solution. (Lisk-FIRL)

MOVAL OF COLOR FROM CARBONATE LPING EFFLUENT THE CALCIUM-MAGSIUM COAGULATION PROCESS,
itute of Paper Chemistry, Appleton, WI.
. Lathia, and T. W. Joyce.
pi, Vol. 61, No. 10, p 67-70, October, 1978. 4 4 tab, 11 ref.

criptors: *Pulp wastes, *Color, *Coagulation, emical precipitation, *Industrial wastes, Lime, gnesium, Hydrogen ion concentration, Separa- techniques, Sludge disposal, Chemical reacs, Waste water treatment.

increased use of sulfurless 'carbonte' pulping nany neutral sulfite semichemical (NSSC) mills vided the impetus for experiments to remove at 90% of the color from a whole-mill effluent oagulation with minimum quantities of calcium magnesium salts. Jar tests demonstrated that ppm dosages of calcium or magnesium ion at a of 12 would provide the desired degree of r removal. A regression equation was devel- from the experimental data to predict the ent color removal at any given salt dosage and Comparison of infrared spectra for NSSC and onate effluents indicated that the NSSC efflucontained significant amounts of carbonate, te, Tiosulfate, lignin, lignosulfate, and carboxgroups; the carbonate effluent contained only ficant amounts of carbonte and was predomid by aromatic nuclei rather than carboxylic ps. Chemical precipitation was cited as the r mechanism of color removal by the limenesium coagulation process. The process was rently reversible as the resulting sludge would ssolve and color return to the effluent when pH was lowered to about 7.6; this phenomenon to a recommendation that the raw sludge be erated before disposal. (Schulz-FIRL)

ICITY REMOVED BY FOAM SEPARAN,
sh Columbia Research Council, Vancouver.
of Applied Biology.
Ng, L. A. Gutierrez, and J. C. Mueller.
strial Wastes, Vol. 24, No. 5, p 36-38, 40-41, 5 fig, 3 tab, 12 ref.

criptors: *Aeration, Toxicity, *Foam separa- *Pulp wastes, *Pulp and paper industry, ching wastes, Pilot plants, Chemical wastes, ration techniques, Turbines, Bubbles, Industrastes, Waste water treatment.

studies at two bleached draft mills in Canada ated foam separation as a means of reducing oxicity of kraft mill effluents. The 100,000 gpd plant employed jet aerators for foam generation, turbines for foam breaking, and a pH control system. Jet aerator performance was evaluated in terms of the effect of jet air load, influent characteristics, retention time, ease of installation and operation, dependibility, and bubble consistency. The turbine foam braker was evaluated in terms of capacity, reliability, and power consumption. Influents from the two kraft mills had toxicity ranges of 6-23 and 1.1-8 hrs (median survival time of fish). Critical gas interfacial areas for detoxification of the two effluents were 5.3-7.8 and 40 sq m/liter at success rates of 89 and 84%, respectively. The jet aerator produced mean bubble sizes of .015 and 1.2 mm at air loads of 0.03 and 0.6 cu m/min, respectively. The three-blade vaned disc turbine was capable of collpsing 1.4 cu m foam/min. (Schulz-FIRL)

REMOVING TOXICITY IN AN AERATED STABILIZATION BASIN,
British Columbia Forest Products LTD., Mackenzie.
K. Chandrasekaran, R. Reis, G. Tanner, and H. Rogers.
Pulp & Paper Canada, Vol. 79, No. 10, p 65-68, 70, 72, October, 1978. 4 fig, 3 tab, 18 ref.

Descriptors: Toxicity, *Aeration, *Oxidation lagoons, *Biological treatment, *Pulp wastes, Pulp and paper industry, Biochemical oxygen demand, Resins, Industrial wastes, Lethal limit, Bioassay, Waste water treatment.

the British Columbia Forest Products Ltd. mill in Mackenzie combines maximum in-plant containment with biological treatment in a 4.7-day aeration lagoon which has achieved average BOD reductions of 88%. A study was conducted over a 28-day period to monotor the toxicity of clarifier inlet, outlet, and aeration lagoon outlet waste water in terms of median fish mortality (LC50), a tocicity emission rate (TER), and toxicity emission index (TEI). The aerated stabilization basin achieved average removal rates of 68% BOD, 90% toxicity, and 96% total resin acids over the study period. The 96hr-LC50 values were 100% or greater for 24 tests. More toxic levels of 77 and 98% for the remaining two samples were attributed to black liquor losses. Resin acids detected at the clarifier outlet included 13.9% pimaric, 20.8% isopimaric, and 65.2% abietic plus dehydroabietic; dehydroabietic acid dominated the stabilization lagoon effluent. The resin content of foam from the lagoon was highly variable. The highest concentrations of resin acids in foam and sludge were in samples collected at a quiescent zone near the lagoon outfall. Unbleached whitewater was the largest contributor to the total untreated toxicity at the Mackenzie mill. (Schulz-FIRL)

COLOR REMOVAL FROM TEXTILE DYE WASTE USING MAGNESIUM CARBONATE,
Auburn Univ., AL. Dept. of Civil Engineering.
J. F. Judkins, and J. S. Hornsby.
Journal Water Pollution Control Federation, Vol. 50, No. 11, p 2446-2456, November, 1978. 8 fig, 2 tab, 5 ref.

Descriptors: *Textiles, Coagulation, *Dyes, *Magnesium carbonate, *Industrial wastes, *Color, Lime, Chemical wastes, Separation techniques, Recycling, Magnesium compounds, Waste water treatment, Effluents, Hydrogen ion concentration.

Jar tests were performed to evaluate coagulation with magnesium carbonate and/or lime for the treatment of textile waste. The experiments utilized seven different dye wastes, including four prepared with synthetic dyestuffs (vatblue 6, vat yellow 22, Levco sulfur blue 7, and disperse blue 7, and disperse blue 3) and three collected from the washboxes on the dye range at a textile mill (vat waste, sulfur dye waste, and a mixture of sulfur and idspersed waste). The magnesium carbonate/lime treatment was vry effective for decoloration of vat wastes and less effective with dispersed dyes; treatment with 50 mg/liter MgCO3 and 330 mg/liter Ca(OH)2 removed 91, 100, and 54% of the color from the synthetic vat, sulfur, and dispersed dye wastes, respectiely. Magnesium recoveries of 87-97% were achieved in studies evaluating the feasibility of recovery following coagulation of synthetic blue vat dye wastes. The high natural pH of the actual textile mill vat wastes (10.0-12.0) made them especially amenable to the combined magnesium carbonate/lime treatment. The combined treatment was more effective than treatment with either lime or magnesium carbonate for all three actual waste streams, although high dosages were required for the sulfur-dispersed waste. (Schulz-FIRL)

RATIONALIZATION AND ENVIRONMENTAL PROBLEMS OF BEAMHOUSE OPERATIONS,
E. F. Miller.
The Leather Manufacturer, Vol. 95, No. 10, p 12, 15-18, 30-33, 20-28, October, 1978. 8 fig, 53 ref.

Descriptors: *Tannery wastes, *Chromium, *Recycling, *Water consumption(Except consumptive use), *Industrial water, Water reuse, Pollutant identification, Proteins, Heavy metals, Effluents, Industrial wastes, Waste water treatment.

Beamhouse operations are discussed with respect to the minimum quantity of water required for leather production and methods of reducing effluent pollutants without impairing the leather quality. Presoaking, soaking/liming, deliming/bating, washing, pickling/tannage, and cleaning are reported to require 2-3, 1-2, 1-2, 1-2, 0.5-1, and 1-2 liters water/kg salted hide or a total of 8.5-15 liters/kg raw hide. Of the tanning waste streams, liming liquor is cited as the strongest source of pollution from the tannery because of its high levels of suspended solids and protein. Pilot studies in several countries have demonstrated that liming liquors may be reused 15-20 times. Protein may be removed from liming liquor by lowering the pH to the isoelectric point of the protein components or by precipitation in an alkaline medium. Methods to improve the quality of effluents from pickling and tannage include precipitation of the chrome tanning agent in the residual liquors, direct reuse, process optimization, and partial replacement of the chrome tanning agent by other materials. THE EVOLUTION OF TANNERY EFFLUENT TREATMENT--GUIDELINES FOR FURTHER INVESTIGATIONS,
S. G. Shuttleworth.
Journal of the Society of Leather Technologists and Chemists, Vol. 62, No. 4, p 87-94, July-August, 1978. 2 fig, 4 tab, 87 ref.

Descriptors: *Tannery wastes, *Biological treatment, *Activated sludge, *Oxidation, Sulfur compounds, Industrial wastes, Pilot plants, Aeration, Return flow, Coagulation, Sludge treatment, Sludge disposal, Trickling filters, Waste water treatment.

Pilot studies on and the development of methods to treat tannery wastes are reviewed extensively. Lagoons have been used to reduce the BOD of tannery effluent as well as to store treated effluent during periods of low river flow or inclement weather. Spray irrigation of grasslands has been practiced successfully for 60 yrs in South Africa. The increased incidence of municipalities having to treat combined domestic/industrial waste streams

has given rise to the development of tannery waste pretreatment and disposal standards. Flue gas and surface aeration have been employed to control the pH of beamhouse liquors. Manganese-catalyzed oxidation, iron salt additions, activated sludge, and acid/alkali processes have been used for sulfide liquors; low sulfide, enzyme, and other sulfide-free processes have been tested as pollution-reducing alternatives to conventional high sulfide unhairing. Equipment modifications have allowed reductions in the quantity of lime required in tanning. Trickling filters, high-rate biofilters, oxidation ditch systems, extended aeration, and the activated sludge process have been employed to biologically treat tannery wastes; physicochemical treatment has generally incorporated additions of iron salts or alum. Pilot studies at a fellmongery and a tannery in South Africa have tested the activated sludge process for the treatment of segregated beamhouse waste and tan liquors. Recommendations are made for further studies to optimize the activated sludge process for tannery wastes and for sludge handling practices. (Schulz-FIRL)

PUBLIC HEARING ON THE DRAFT ENVIRONMENTAL IMPACT STATEMENT RELATING TO PALM BEACH COUNTY SEWAGE TREATMENT IMPROVEMENT PROGRAM.
Palm Beach County Board of Commissioners, FL.
May 22, 1972, Vol. II, 551 p.

Descriptors: *Effluents, *Water quality, *Wastewater treatment, *Public health, *Florida, Public rights, Sewage treatment, Municipal wastes, *West Palm Beach(FL), *Palm Beach County(FL), *Environmental impacts, Public attitudes, Public values, Public participation, EIS review process, Sewage treatment plants.

This is an extensive transcript of a public hearing conducted May 22, 1972 concerning proposed sewage treatment plants in West Palm Beach, Florida. It is the second of two volumes of evidence presented at the public hearing to the regional EPA and includes comments of many people concerned with the environmental consequences of building wastewater treatment plants. Briefly, the town of West Palm Beach started construction on a modern secondary treatment plant which discharged through an outfall into the influence of the Gulf Stream. Construction was halted in 1971 until a final EIS statement was prepared. This volume is useful in helping the regional EPA judge the merits of the wastewater treatment project and the possibilities of providing alternate plans for treating and disposing of municipal wastes. The text provides testimony from expert witnesses on the merits of secondary and tertiary wastewater treatment processes and the subsequent disposal problem of effluents. The public hearing also covering the environmental impact of the proposed project, including the air, land and noise impacts on the recreational areas and historical sites nearby. Public attitudes about the project were recorded. (Coan-NC)

PUBLIC HEARING ON THE DRAFT ENVIRONMENTAL IMPACT STATEMENT RELATING TO PALM BEACH COUNTY SEWAGE TREATMENT IMPROVEMENT PROGRAM.
Palm Beach County Board of Commissioners, FL.
May 22, 1972, Vol. 1.

Descriptors: *Waste water treatment, *Sewage disposal, Primary treatment, Secondary treatment, Tertiary treatment, Sewage treatment, Municipal wastes, *Water quality, *Water pollution control, *Wastewater management, Public water supply, Public health, Biochemical oxygen demand, Public rights, Florida, *Palm Beach County(FL), *Environmental impacts, EIS review process, *West Palm Beach(FL), *Public participation, Public values.

This report is a compilation of documents presented at a public hearing on May 22, 1972 at the County Commission Chambers in the Palm Beach County Courthouse, West Palm Beach, Florida. All documents were presented to the regional EPA concerning the environmental impacts of the proposed sewage disposal plants in West Palm Beach. These facilities originally included a proposal for tertiary treatment by the use of polishing ponds and discharge into the ship's channel of Lake Worth and an alternate plan to have a modern seconary treatment plant with discharge through an outfall into the influence of the Gulf Stream. The alternate plan was approved by the necessary agencies, financial arrangements were made, and some construction was begun. In 1971, all construction was stopped until a final EIS was produced. This report aids EPA's EIS reviews process by presenting all sides in the controversy surrounding the construction of the treatment facilities. Governmental agencies submitted reports, consulting firms conducted studies and submitted their findings, area specialists were contacted and their advice is recorded. The document lists testimony by area of public interest groups and city and county officials, newspaper stories covering the debates, attorney's briefs on the relevant legal issues, and all other relevant papers submitted to the EPA concerning the treatment facilities. (Coan-NC)

PROCESS FOR THE PURIFICATION OF INDUSTRIAL EFFLUENTS,
Ciba-Geigy Corp., Ardsley, NY. (Assignee).
H. Wegmuller, and J. Haase.
U.S. Patent No. 4,104,160, 9 p, 11 ref; Official Gazette of the United States Patent Office, Vol 973, No 1, p 276, August 1, 1978.

Descriptors: *Patents, *Waste water treatment, *Industrial wastes, Water purification, *Water pollution treatment, Color, Separation techniques, Cellulose, Absorption, Chemical precipitation, Filtration, Paper and pulp industry, Dyes.

A process for the purification of industrial effluents, especially for the decolourisation of waste liquors arising in the textile, paper and leather industry is described where the effluents are brought into contact with cellulosic absorbent which has been pretreated with precipitants. Preferably, filters of cellulose itself or of waste sheets from printing are used. Three processes are suitable for this purpose: the so-called stirring process where the water to be purified is stirred with the pretreated cellulose material in a vessel and the cellulose material and water are then separated; the so-called flow bed process in which the pretreated cellulose material is kept in the suspended state by the counter-current flow of the liquor to be purified; and the so-called filtration process where the liquor to be purified is passed through pre-treated cellulose filter material. Of these three process variants, the filtration process is preferable. (Sinha-OEIS)

APPARATUS FOR PURIFYING WA WATERS,
F. Besik.
U.S. Patent No. 4,104,167, 12 p, 5 fig, 2 tab, 1 Official Gazette of the United States Patent O Vol 973, No 1, p 278, August 1, 1978.

Descriptors: *Patents, *Waste water treat *Sewage treatment, *Industrial wastes, *Biolo treatment, Water pollution treatment, Water ity control, Chemical reactions, Activated slu Chemical precipitation, Flocculation, Equipr

An apparatus in which contaminants from the raw r waste waters are removed by combined biologi-al-chemical degradation comprises first, second nd third chambers. An aeration zone is provided the first chamber. A slanted plate is located in ne second chamber to define an aeration zone vhich overlies a sludge separation zone. Means for ransfering such waters from the equalization zone o the upper region of the aeration zone is pro-ided. The slanted plate provides for a downflow f waters through the aeration zone and an upflow f waters through the sludge separation zone, vhere due to the lower end of the slanted plate eing spaced from the lower portion of the second hamber wall forms a constriction to the flow of udge separation zone. The height of the sludge eparation zone is sufficient to dampen the upward ow of the waters to develop a quiescent region in ne upper portion of the sludge separation zone. leans for dispersing air into the active media vhich is circulated through the upward flow chan-el is provided. The third chamber has clarifying one. (Sinha-OEIS)

LUDGE SETTLING AND DE-WATERING AP-ARATUS,
G. Kiss.
.S. Patent No. 4,104,168, 6 p, 5 fig, 11 ref; Official azette of the United States Patent Office, Vol 73, No 1, p 278, August 1, 1978.

escriptors: *Patents, *Waste water treatment, Water pollution treatment, Sludge disposal, Vater purification, Oily water, Separation tech-ques, Settling basin, Gravity, Waste disposal, uspended solids, Industrial wastes, Dredge spoil.

nprovements in sludge settling and de-watering paratus or sludge consolidator means include eans to remove oil, fat solids and other lighter an water substances as well as heavier than water bstance from residue water. The sludge is proc-sed by vibratory means aided by gravity that is fective to insure that all substances heavier than ater are carried by gravity to the bottom of the ater mass for discharge. Generally, the sludge nsolidator includes a vertically arranged cylin-r or tank which comprises three divisions or mpartment arranged one above the other. In peration, sludge is collected in and clear water scharged from a middle compartment; heavy lids settling out of the water are collected in the ttom compartment. The upper compartment col-cts suspended substances that are lighter than ater and discharges them through a valved outlet the upper end. Clear water remaining is filtered d then discharged at a level above the sludge vel. (Sinha-OEIS)
779-01881

ROCESS FOR REMOVING CYANIDE-CON-AINING COMPONENTS FROM AQUEOUS EDIA,
readwell Corp., New York. (Assignee).
Muller, and J. M. Schreiner.
S. Patent No. 4,105,545, 5 p, 2 tab, 5 ref; Official azette of the United States Patent Office, Vol 3, No 2, p 735-736, August 8, 1978.

escriptors: *Patents, *Waste water treatment, ndustrial wastes, *Water pollution treatment, eparation techniques, Ammonia, Bubbles, zone, Adsorption, Oxidation, *Cyanides, Adsub-e separation, Steel industry.

method for treating cyanide laden waste water luents derived from coke-oven operations, blast rnace blowdown and other industrial wastewater described. The process for removing cyanide-ntaining components from aqueous media, par-ularly weak ammonia liquors comprises: con-cting the media with bubbles in the presence of a llector to remove a substantial amount of com-exed and simple cyanide; and contacting the edia with ozone to substantially remove the re-aining cyanides. This method is a combination of adsorptive bubble separation commonly called lsubble separation' followed by an ozone oxida-n treatment. (Sinha-OEIS)

METHOD AND APPARATUS FOR PURIFICATION OF WATER,
Ebara Infilco Kabushkik Kaisha, Tokyo (Japan). (Assignee).
Y. Kakumoto, M. Kanegawa, T. Iwaizumi, and N. Matsumoto.
U.S. Patent No. 4,105,549, 15 p, 15 fig, 2 tab, 4 ref; Official Gazette of the United States Patent Office, Vol 973, No 2, p 736-37, August 8, 1978.

Descriptors: *Patents, *Water treatment, *Waste water treatment, *Water purification, Water pollution treatment, Separation techniques, *Activated carbon, Adsorption, Water quality control, Carbon slurry, Packed bed.

Water or waste water is purified by passing it through a packed bed of active carbon. The apparatus comprises a tank having a packed bed formed of active carbon including in the upper portion of the tank at least one tube for flowing in a fluid to be treated into the tank and at last one tube for flowing an active carbon slurry out of the tank. In the lower portion of the tank at least one tube is provided for flowing the treated fluid out of the tank and at least one tube for flowing an active carbon slurry into the tank. In the course of the adsorption treatment the fluid to be treated is passed through the active carbon bed downwardly. During replenishment of the bed, regenerated or fresh active carbon is introduced under pressure into the lower portion of the active carbon bed as a slurry and used active carbon present in the upper portion of the active carbon layer is discharged as a slurry together with solids and colloidal material. (Sinha-OEIS)
W79-01886

OIL-CONTAINING EFFLUENT TREATMENT BY GRAVITY SEPARATION,
British Petroleum Co. Ltd., London (England). (Assignee).
G. F. Oldham.
U.S. Patent No. 4,105,553, 5 p, 2 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 973, No 2, p 738, August 8, 1978.

Descriptors: *Patents, *Waste water treatment, *Industrial wastes, *Oil wastes, *Separation techniques, Water pollution treatment, Filtration, Heating, Graity separation, Oil recovery.

Oil-containing effluent such as refinery or other industrial plant effluent is treated by passing it through a gravity separator and obtaining (1) a wet oil fraction, (2) an aqueous fraction of reduced oil content, and (3) a wet oily sludge. Fractions (1) and (3) are then combined and passed through a pressure filter so that solids are retained and oil and water passed through. The oil and water are then passed to a separator and a reusable oil fraction is recovered and the water fraction is returned to the gravity separator. Fraction (3) requires to be heated to permit the water, oil and solids to separate. (Sinha-OEIS)
W79-01888

LIQUID WASTE PROCESSING SYSTEM,
Combustion Engineering, Inc., Windsor, CT. (Assignee).
E. R. D'Amaddio, and D. N. Enegess.
U.S. Patent No. 4,105,556, 5 p, 1 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 973, No 2, p 739, August 8, 1978.

Descriptors: *Patents, *Waste water treatment, *Water purification, Industrial wastes, *Radioactive wastes, Water pollution treatment, Separation techniques, Water quality control, *Filtration, *Reverse osmosis, *Evaporation, Ion exchange, Water reuse, Evaporators.

The liquid waste processing system first chemically treates the waste liquid, second filters out the solid particles of waste liquid in a back-flushable filter, third processes the wastes by a reverse osmosis module, and finallly concentrates the concentrate in a thin-film evaporator. After an appropriate degree of chemical pretreatment, the liquid waste is pumped from the holding tank through a filter which removes a large fraction of the particulate and precipitated solids. The waste liquid is then treated by a reverse osmosis module which results in an extremely pure permeate and concentrate containing the undesirable elements. This concentrate is next passed to a thin-film evaporator which further concentrates the concentrate. The distillate from the thin-film evaporator is recycled to the inlet of the reverse osmosis module while the concentrate is discharged to the solid waste processing system. The permeate from the reverse osmosis module may be further purified by an ion exchanger and either discharged to the environment or recycled into the system as a relatively pure and useful liquid. (Sinha-OEIS)

NORTH SLOPE BOROUGH WATER STUDY, A BACKGROUND FOR PLANNING,
Alaska Univ., Fairbanks. Inst. of Water Resources.
R. A. Johnson, and L. D. Dreyer.
Alaska Department of Natural Resources Report, June 1977. 115 p, 17 fig, 2 append.

Descriptors: *Planning, *North Slope Borough(AK), *Water utilization, *Water supply, *Waste water treatment, *Sewage treatment, Regional analysis, Regional development, *Alaska, Bibliographies, Potable water, Alternative planning, Land use, Arctic, Cold regions, Biological treatment, Anaktuvuk Pass(AK), Atkasook(AK), Barrow(AK), Kaktovid(AK), Nuiqsut(AK), Point Hope(AK), Point Lay(AK), Wainwright(AK).

Water use in the eight villages of Alaska's North Slope Borough is examined to assist in evaluating and planning for present and future water use, treatment, and disposal requirements. Information on location, physical setting, and land use are summarized for Anaktuvuk Pass, Atkasook, Barrow, Kaktovid, Nuiqsut, Point Hope, Point Lay, and Wainwright. An extensive bibliography is appended, and there are sections on alternative technologies in arctic water supply and wastewater treatment, and on foreseeable developments affecting water and land use allocations. About half of rural Alaskan villages need immediate improvement in domestic water supplies and face serious problems of contamination of natural waters with

untreated sewage. Many Alaskan waters are high in iron and manganese, and removal is expensive; however, these metals constitute an aesthetic rather than a health problem. Advanced processes are required to treat brackish and saline waters. For wastewater purification, physical-chemical operations are not normally used in cold regions, but a variety of biological treatment processes are suitable. Septic tanks and faculative lagoons usually must be heated. Important future development in the region include a shift in major construction activity to the Brooks Range foothills and Point Lay coastal plain with intensive oil and gas exploration, and possible coal development near Atkasook. (Lynch-Wisconsin)

FUNGAL DEGRADATION OF ANAEROBICALLY DIGESTED SEWAGE SLUDGE,
Auburn Univ., AL.
W. M. Hagler, Jr., N. D. Davis, and U. L. Diener.
Mycopathologia, Vol. 58, No. 3, page 177-181, 1976. OWRT A-030-ALA(2).

Descriptors: *Sludge degradation, *Sewage sludge, *Anaerobic digestion, *Fungal degradation, Biodegradation, Humus, Sludge disposal, Waste disposal, Cunninghamella elegans, Rhizopus oligosporus, Myrothecium verrycaria.

Sewage sludge is a stable humic material that breaks down slowly with time when mixed with soil. The disposal of sewage sludge is one of the problems of environmental pollution throughout the world. Approximately 455,000 cubic meters of sewage sludge are produced daily in the United States (7). The development of supplementary methods of sewage treatment to be used in tandem with anaerobic digestors are of current interest. Benefits of such a tandem system utilizing fungi would be the acceleration of recycling of waste, supplemental detoxification of sludge, and perhaps even recovery of utilizable protein. The use of fungi to accelerate sludge degradation with the possible side benefits of production of protein or other recoverable metabolites has not been investigated. This paper reports the screening of fifty fungi for their ability to grow on and degrade anaerobically digested sewage sludge and the determination of the level of protein produced by C. elegans on this medium.

MYCOFLORA OF ACTIVATED SEWAGE SLUDGE,
Auburn Univ., AL. Water Resources Research Inst.
U. L. Diener, G. Morgan-Jones, W. M. Hagler, and N. D. Davis.
Mycopathologia, Vol. 58, No. 2, p 115-116, 1976. OWRT A-030-ALA.

Descriptors: *Mycoflora, *Activated sludge, Serial dilution, Sewage sludge, Isolation, *Alabama, Auburn(Ala), *Anaerobically digested sludge, Pollutant identification, *Fungi.

Thirty-eight species of fungi were identified in pure culture after isolation from activated sewage sludge by serial dilution. Nine species and genera were identified that had not been previously reported. In 1963, Cooke (1) published an excellent laboratory guide on the identification of fungi from polluted water, sewage, and sewage treatment systems; of approximately 30 papers cited only one (2) dealt with fungi from activated sewage sludge. Later (1970), Cooke and Pipes (3) enumerated 47 fungi consisting of 4 genera of yeasts and 33 genera of filamentous fungi that had been isolated from activated sludge. This paper reports the mycoflora of anaerobically digested sludge from a residential area in Auburn, Alabama.

Presented at TAPPI Environmenta Conference, Washington, D.C., April 12-14, 1978, Preprinted Proceedings, (TAPPI, Atlanta, Georgia 30338), p 193-206. 11 fig, 12 ref.

Descriptors: *Sludge disposal, *Landfills, *Pulp and paper industry, Wastes, Industrial wastes, Water pollution sources, Pulp wastes, Solid wastes, Design, Operation and maintenance, Activated sludge, Sludge, Soil mechanics, Consolidation, Permeability, Field tests, Laboratory tests, Soil stability, Maine, Ultimate disposal, Disposal, Water pollution control.

Many of the environmental problems associated with the design and operation of sludge landfill disposal sites may be related to a lack of information about the geotechnical behavior of activated sludge. Basic soil mechanics theories of consolidation, shear strength, and permeability are presented along with their relationship to the performance of pulp and paper mill sludge. The results of laboratory tests and field observations are summarized and briefly discussed. The use of soil mechanics methods to consolidate the sludge and thus increase the stability of the deposit is illustrated at Boise Cascade Corp.'s landfill site located on the eastern slope of Farrington Mountain in Mexico, Maine. LIQUID MANURE AND ENVIRONMENT PROTECTION, (IN GERMAN),
A. Forster.
Landtechnik, Vol. 27, No. 8, p. 166-168, April, 1972. 5 fig.

Descriptors: *Liquid wastes, Odor, Regulation, Transportation, *Farm wastes, *Field spreading, Sweden, Switzerland.

A great number of farmers use liquid dung a manure on their fields because transportation cost for this method can be reduced by 30-40%. Severa European contries provide for special environmen protection measures to be applied in this case Similar to the regulations for the storing of oils an chemical agents, those for storing and utilizin liquid manure will depend on whether the drinkin water in the various regions is endangered by th liquid dung. In Sweden and Switzerland, storin liquid dung for 4-9 months is obligatory becaus after this time a great number of pathogenic micro organisms are destroyed and risk is considerabl reduced. Another reason is that during specia periods such as holidays or in high pressure area spraying liquid dung onto the fields is not allowe in order to prevent the formation of bad odor Large farms will have to provide for dung deodor ization in the future in order to avoid the presen disadvantages of dung utilization. Dung deodoriza tion can be effected mechanically, thermall chemically, or biologically; the latter seems to b the most perfect and economical method. The bio logical treatment can be effected in a cold, war or hot way, however, the cold method is the lea advantageous since the fertilizing value in its liqui phase is extremely low. Dung treated in th manner can be distributed by means of a sprayin device without causing difficulties, however, will be economical only for farms with an annua dung production of more than 8,000 cu m of liqui dung. Smaller farms should use the new glass-fib truck-mounted tanks of a volume of 8,000 liter (Solid Waste Information Retrieval System)
W79-01628

FIELDS OF USE AND APPLICATION O MANURE AND MANURE DISPOSAL, (I GERMAN),
V. G. Blanken.
Landtechnik, Vol. 25, No. 21, p. 674-676, Noven ber, 1970.

Descriptors: *Fertilizers, *Waste treatmen *Waste disposal, Incineration, Drying, Economic Groundwater, *Farm wastes, *Dumping, Lan spreading.

Manure can be used for fertilizing agricultur areas, it can be dumped, destroyed by chemica biologically decomposed or incinerated. Its use fertilizer is still the most economic method f disposal of manure, provided that there is agricu ture in the area. If not, one of the other metho must be selected. Drying has proved to be ec nomical only in the case of chicken manu Drying costs for the manure of about 40,000 chic ens run at DM 7.00. Conversion into humus justified only if there is a sufficiently large mark for the product. Costs are DM 10.75 for 8,0 chickens. In the absence of a market for manure, seems to be best to subject it to biological deco position. There is, however, the problem of dispo al of the residual matter. Incineration would be t best method from a sanitary point of view, but it too expensive. Dumping is too dangerous for t environment. Pollution of the environment larvae and worm eggs can be avoided, by stori the manure in large containers for long periods time. For protection of the groundwater sm amounts of manure ought to be spread over t fields at one time, and used on flat acres onl (Solid Waste Information Retrieval System)
W79-01633

UTILIZATION AND DISPOSAL OF LIQUID MANURE AT SMALL AVAILABLE SPACE, (IN GERMAN),
V. H. Traulsen.
Landtechnik, Vol 25, No. 21, p. 665-668, November, 1970. 7 fig, 7 ref.

Descriptors: *Liquid wastes, *Waste treatment, *Waste disposal, Economics, Odor, Groundwater pollution, Pathogens, Incineration, Drying, *Farm waste, Land spreading, Spraying, Composting, Oxidation tanks, Germany.

Of the manure disposal and utilization methods, spraying of liquid manure over crops is the least expensive one. Generally 40-60 cbm liquid manure can be applied per hectare and year. Some plats such as corn are able to consume up to 100 cbm per hectare and year, asparagus as much as 200 cbm. Pathogenic germs are not killed by this method. In the German Democratic Republic, it is required to store manure for 21 days before it is applied to the fields. Studies have shown that salmonellas survive almost one year in liquid manure. Other drawbacks of this method are that the manure cannot be applied to the fields at each season since it causes annoying odors and pollutes groundwater. Spreading over areas which are then withdrawn from agricultural use for one or more years bears the same disadvantages. Composting by mixing with lime, peat, and styropor has not been done yet with any manure other than chicken manure. Decomposing in lagoons does not kill all pathogenic germs either. Anaerobic decompostion is too expensive. Incineration is the most hygenic method but it involves high investment and operating costs. Composting and drying and oxidation tanks are the most economical methods available at the moment. (Solid Waste Information Retrieval System)

AQUATIC DISPOSAL FIELD INVESTIGATIONS, ASHTABULA RIVER DISPOSAL SITE, OHIO; EVALUATIVE SUMMARY,
State Univ. of New York, Buffalo. Great Lakes Lab.
J. A. Sweeney.
Available from the National Technical Information Service, Springfield, VA 22161, as ADA-055 865 Price codes: A07 in paper copy, A01 in microfiche. Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, Technical Report D-77-42, June 1978. 125 p 6 tab, 19 fig, 46 ref.

Descriptors: *Aquatic environment, Environmental effects, *Lake Erie, *Dredged material disposal, *Waste disposal site, *Ashtabula River.

Evaluates impacts of the release of dredged material on chemical and physical aspects of the aquatic and benthic environments as well as phytoplankton, zooplankton, benthos, and fish in Lake Erie off Ashtabula, Ohio, from June 1975 through September 1976. Samples and measurements were taken prior to, during, and after the release of materials from a hopper dredge during August 1975 and May 1976. Impacts on the water column including the phytoplankton zooplankton communities were short lived. While the benthos as well as the chemical and physical nature of the sediments were altered, predisposal conditions generally were reestablished within a year after the release of the dredged material. Storm event related erosion of the dredged material appeared to be a major factor in the recovery of the area. There was no evidence of accelerated uptake of heavy metals by fish or benthos as a consequence of disposal. Harbor macroinvertebrates, transported with the dredged materials, did become established in the depositon area. With the exception of the latter, the obseved impacts were similar to those noted in studies to evaluate the impact of dredged materials on the marine environment. (WES)

USE OF DREDGED MATERIAL ISLANDS BY COLONICAL SEABIRDS AND WADING BIRDS IN NEW JERSEY,
Manomet Bird Observatory, MA.
F. G. Buckley, and C. A. McCaffrey.
Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, Technical Report D-78-1, June 1978. 205 p, 4 append. 9 tab, 47 fig, 49 ref.

Descriptors: *Birds, *Shore birds, *Islands, *New Jersey, *Dredged material, *Colonial birds.

Use of dredged material islands by colonial nesting seabirds and wading birds in New Jersey was examined in five major phases. The first located dredged material islands from Manasquan to Cape May Inlets, NJ; the second recorded the past history of all colonial nesting seabirds and wading birds in New Jersey; the third recorded the vegetation patterns and succession on 21 dredged material islands; the fourth recorded the distribution in 1977 of colonial seabirds and wading birds in the study area and their utilization of dredged material islands; and the fifth documented those factors influencing the use and selection of dredged material islands by birds in 1977. Plant communities were placed into 15 categories. The most important ones for birds on the dredged material study islands were bare, common reed, reed-shrub, shrub, shrub-forest, shrub-dense grassland, and dense grassland. No statistically significant vegetation differences were found between the bird (colony) and vegetation (non-colony) study islands, thus other factors, notably microtopography, past history of colony success, and freedom from disturbance by quadruped predators and humans, seem most important in determining island use by birds, given certain minimal habitat requirements. Nineteen management recommendations for dredged material islands are stated. (WES)

SOME FACTORS AFFECTING DENITRIFICATION IN SOILS IRRIGATED WITH WASTEWATER,
Ohio State Univ., Columbus. Dept. of Agronomy.
S. S. Barr, R. H. Miller, and J. T. Logan.
Journal Water Pollution Control Federation, Vol. 50, No. 4, p 709-717, April, 1978. 6 fig, 5 tab, 17 ref. OWRT B-059-OHIO(2).

Descriptors: *Denitrification, *Spray irrigation, *Soil amendments, *Carbon, *Hardwood, Grasses, Return flow, Clay loam, Sands, Nitrates, Nitrogen fixing bacteria, Application methods, Waste water treatment, Waste water disposal, Municipal wastes.

Biological denitrification was investigated at soil sites irrigated with waste water by the Pennsylvania State University waste water management project. The three clay loam soil sites included a plot of reed canarygrass, a hardwood forest, and an abandoned field; the fourth mixed hardwood site was formerly designated as gameland and consisted of loamy sand. The sites had been spray irrigated with waste water since 1963; untreated control sites were also maintained and soil samples were collected at various depths four times in two years. The top 7.5 cm of the treated soil sites contained the highest organic carbon and total nitrogen levels, and carbon/nitrogen ratios. All soils and vegetation exhibited low denitrification potentials attributed to a shortage of available organic carbon. This assumption was supported when denitrification increased after glucose was added to the soils as a carbon source. Carbon supplements added in the form of plant residues in the wastewater could not support denitrification below the 15 cm root zone, indicating that excess nitrate would leach into the groundwater. Reducing nitrogen levels in the waste water and increasing carbon sources during periods when crops were not grown was recommended. (Lisk-FIRL)

T. Horikoshi, O. Ebinuma, and M. Yamagoshi.
Kami Pa Gikyoshi (Jour of the Japanese Technical Assoc. of Pulp and Paper Industry), Vol. 32, No. 10, p 46-51, 1978. 13 fig, 7 ref.

Descriptors: *Flocculation, *Recycling, *Pulp wastes, *Sludge disposal, *Pulp and paper industry, Separation techniques, Coagulation, Air pollution control, Sludge treatment, Chemical oxygen demand, Color, Industrial wastes, Waste water treatment, Waste water disposal.

Research at the Oji Paper Co., Ltd., in Japan on the flocculation and treatment of pulp mill effluent examined methods to recover and reuse alum sludge as a coagulant for COD and color removal. Alum recovery was achieved by reaction of kraft pulp effluents with sulfuric acid which had been generated using sulfur dioxide from boiler stack gases. Alum sludge ash prepared at pH 12.0 with Ca(OH)2 was successfully recovered by treatment with sulfuric or hydrochloric acid, followed by incineration at 900C. Alum sludge prepared at a low pH of 5-8 was treated with lime or calcium carbonate before incineration; this method also provided a reusable product. Closed systems were designed for both the high and low pH sludges. The low pH system incorporated mixing with alum and lime, clarification, mixing with lime and calcium carbonate, dewatering, incineration, reaction with sulfuric or hydrochloric acid, and separation of insoluble materials before recycling of the alum to the first stage of the treatment process. The system could be augmented with desulfurization of stack gases to provide the sulfuric acid. (See also W76-09284) (Schulz-FIRL)

Group 5E—Ultimate Disposal Of Wastes

STATE OF THE ART REPORT ON PESTICIDE DISPOSAL RESEARCH,
Midwest Research Inst., Kansas City, MO.
R. R. Wilkinson, E. W. Lawless, A. F. Meiners, T. L. Ferguson, and G. L. Kelso.
ACS Symposium Series, No. 73, p 73-80, 1978. 22 ref.

Descriptors: *Incineration, *Pesticides, *Ozone, *Ultraviolet light, *Industrial wastes, *Biological treatment, Herbicides, 2,4-D, DDT, Organic pesticides, Carbamate pesticides, Total organic carbon, Costs, Pesticide removal, Waste treatment, Waste water treatment.

A state-of-the-art review of pesticides disposal research is presented with particular emphasis on high-temperature incineration, physicochemical methods, and bioconversion technology. High-temperature incineration has been employed for organic pesticides, Kepone, Mirex, organochlorine process wastes, and Herbicide Orange; efficiencies of up to 99.9% are possible with incineration although capital costs are high and scrubbing may be required. A data base covering incineration of pesticides has been established. Chlorolysis, Zimpro wet oxidation, and ozone/ultraviolet (UV) irradiation comprise the current chemical treatment methods used for pesticides. Wet oxidation with air or oxygen has yielded substantial reductions in total organic carbon (TOC) levels of wastes containing DDT, 2,4-D, pentachlorophenol, Amiben, and Atrazine; further studies to monitor the effects of wet oxidation on the active ingredients, rather than TOC alone, are recommended. Chlorolysis has been proven particularly effective for high chlorinated and diene-based pesticides. Ozone/UV irradiation has been optimized for chlorinated hydrocarbons, organophosphates, and carbamates. Microbial degradation has been successfully employed to decompose parathion into simpler phosphoric acids and phenols. (Schulz-FIRL)

LEATHER TANNING INDUSTRY-SLUDGE PROBLEMS AHEAD,
R. Dawson.
Sludge Magazine, Vol. 1, No. 5, p 24-27, September-October, 1978.

Descriptors: *Chromium, *Tannery wastes, *Sludge disposal, *Heavy metals, *Industrial wastes, Ultimate disposal, Recycling, Fertilizer, Sludge treatment, Dewatering, Oxidation, Waste water treatment.

Approximately 80-85% of the leather tanned by the 298 tanneries in the U.S. is treated by chromium processes which generate large quatities of potentially hazardous sludge containing Cr(III), Zn, Pb, and Cu. A tabulation by states and regions of the projected leather tannery waste generation is presented for the wet and dry total process solid waste and total potentially hazardous wastes for 1977 and 2983. A survey by SCS Engineers noted that filter pressing was the preferred method for dewatering sludge and that 60% of the sludge was ultimately landfilled. New EPA standards for hazardous waste disposal are anticipated to be proposed during 1979. Current studies are examining methods to recover the chromium and the effects of using tannery sludges as soil conditioners or fertilizers. The APS catalytic molten salt incineration system is designed to burn off the organics and produce a chromium-rich ash. (Schulz-FIRL)

Journal of Chromotography, Vol. 158, p. 437-447 1978. 3 fig, 3 tab, 43 ref. OWRT A-056-ALA(1).

Descriptors: *Water treatment, Gas chromatography, *Mass spectroscopy, Hydrocarbons, Volatile organics, *Pollutant identification.

Volatile organics were determined during all stages of the water treatment process in a municipal water works. Analytical parameters for a quantitative procedure were investigated. The method used allows simultaneous determination of both halogenated and non-halogenated purgeable organics. Approximately 70 substances were identified by gas chromatography-mass spectrometry with capillary columns. Well water contained considerable quantities of aliphatic and aromatic substances. Halocarbons were formed during both steps of a double chlorination procedure, but the largest quantity was generated during the first step. Only tetrachloroethylene was present in untreated surface water in significant quantities. Most hydrocarbons were carried through the treatment process from the raw water to the finished water with little change in concentration.

NVESTMENT PLANNING FOR COLORADO IVER SALINITY CONTROL,
alifornia Univ., Los Angeles. Graduate School of anagement; and California Univ., Los Angeles. ept. of Engineering Systems.
. Erlenkotter, and C. R. Scherer.
n: 'Colorado River Basin Modeling Studies' Semi-ar Proceedings, held July 16-18, 1975 Published arch 1976, Utah Water Research Laboratory, ogan, p. 71-85. 1 fig, 2 tab, 11 ref, (California ater Resources Center Project UCAL-WRC-W-74). OWRT B-170-CAL(1).

Descriptors: *Mathematical models, *Colorado River, *Salinity control, Costs, Economics, Model studies, Investment, Planning.

This study considers the problem of scheduling investment in salinity control projects on the Colorado River. Each project offers the possibility of preventing an amount of salt from entering the river. Diversions (consitent with 'present modified' flows) are made along the river for various users. These users (primarily lower basin) incur damage as river salinity rises with time due to intensifying use upstream. The problem is to find that schedule of investments which minmizes the discounted sum of project investment and operating costs, ad downstream salinity damages over time, subject to optional equity-oriented restrictions on (1) financing arrangements and (2) quality at selected points along the river. Note that while quality restrictions are mentioned, they are optional. Hence this is more than a cost-effective analysis. Rather, the approach taken is to let the salinity profile of the river be determined endogenously within the model, with the optimal timing of investment based on the dynamic trade-off of investment costs and associated downstream damages. ADVENTURES IN DESIGNING FOR 1984 EFFLUENT REDUCTION,
Gulf States Paper Corp., Tuscaloosa, AL.
R. R. Fuller.

Descriptors: *Pulp and paper industry, *Water pollution control, *Treatment facilities, *Legislation, *Design, *Alabama, Pulp wastes, Water pollution sources, Water pollution treatment, Wastes, Industrial wastes, Biological treatment, Tertiary treatment, Solid wastes, Biochemical oxygen demand, Freshwater, Water purification, Water reuse, Recycling, White liquor(Kraft process), Green liquor(Kraft process), White water(Paper machines), Kraft mills.

A review is presented of the impact of proposed 1984 effluent discharge regulations on the design of water pollution control facilities at an integrated kraft pulp and paper mill in Tuscaloosa, Alabama. Existing treatment facilities (including the UNOX biological process) and tertiary treatment alternatives are discussed in terms of their potential for removing solid wastes, 5-day BOD, and effluent solids generated during pulp washing and screening, green and white liquor and fresh water clarification, evaporatory clean-out, and white water recycling. NBC REQUESTS EXEMPTION FROM RUNOFF RULES.
Feedstuffs, Vol. 48, No. 6, p 22, February 9, 1976.

Descriptors: *Poultry, *Regulation, Water pollution, *Broilers, *National Pollutant Discharge Elimination System.

The National Broiler Council (NBC) has filed a request with the Environmental Protection Agency asking an industry exemption from proposed regulations that would require National Pollutant Discharge Elimination System (NPDES) permits for large broiler operations. Broiler growout operations with more than 290,000 birds for a cumulative total of 45 days in any 12-month period would be considered a 'concentrated animal feeding operation point source' in the eyes of the regulation. In the event EPA cannot grant an industry exemption, NBC said the criteria for determining whether a broiler operation has a measurable discharge of pollutants into navigable waters should be clarified. WEIR DESIGN TO MAINTAIN EFFLUENT QUALITY FROM DREDGED MATERIAL CONTAINMENT AREAS,
Army Engineer Waterways Experiment Station, Vicksburg, MS.
T. M. Walski, and P. R. Schroeder.
Available from the National Technical Information Service, Springfield, VA 22161 as ADA-056 062 Price codes: A06 in paper copy, A01 in microfiche. Technical Report-D-78-18, May 1978. 106 p, 3 append, 33 fig, 35 ref.

Descriptors: *Effluents, *Weirs, *Stratified flow, Suspended solids, Design criteria, *Containment area, *Dredged material.

The suspended solids concentration in the effluent water from an upland containment area being filled with fine-grained dredged material can be significantly influenced by the length of the weir and the depth of the ponder water. This study develops a procedure for designing and operating the weir to maintain good effluent quality, given a flow and dredged material type. Stratified-flow and sediment-transport models were investigated to describe the depth of withdrawal, velocity profile, and effluent suspended solids concentration, given a concentration profile and flow. Field data on these parameters were collected at three sites--Yazoo River, MS, Fowl River, Al, and Oyster Bay, AL. The Waterways Experiment Station's selective withdrawal model developed by Bohan and Grace, modified to fit observed data, was selected as the basis of the design procedure. Using this model, nomograms were developed for the design procedure for silt and saltwater clays ad for freshwater clays. Proper operation of the weir can ameliorate the effects of short-circuiting or an undersized basin. In general, the weir crest should be maintained at as high an elevation as feasible during dredging operations. Guidance for operation of the weir for special applications is also presented. (WES)

In: Hydrology and Water Resources in Arizona and the Southwest, Vol. 7. Proceedings of the 1977 Meetings of the Arizona Section, American Water Resources Assn.; and the Hydrology Section, Arizona Academy of Science, April 15-16, Las Vegas, Nevada, p 69-78. 1 fig, 4 tab, 13 ref. OWRT B-043-ARIZ(27), B-055-ARIZ(1).

Descriptors: *Model studies, *Mathematical models, *Decision making, *Multiple-purpose projects, *Strip mine wastes, *Reclamation, Arizona, Black Mesa, Livestock, Runoff, Mine wastes, Flow augmentation, Farming, Crops, Sediment control, Fish harvest, Ponds.

Using the Black Mesa area in northern Arizona, a case study was made based on a decision making algorithm called PROTRADE (Probabilistic Tradeoff development Method). Five objectives to be achieved in reclaiming this overgrazed and now mine-spoiled acreage were considered: (1) livestock production, (2) augmentation of water runoff), 3) farming of selected crops, (4) control of sedimentation rates, and (5) fish ponds harvesting. The methodology employed in this study is given by way of formulae applied to each of these objectives. Results indicate that the algorithm allows for objectives were in conflict and competition with each other, particularly in competition for water, goal values obtained were short of their maximum value of unity, with sediment being the exception. By expressing the functions of the objectives in their respective natural units, rather than in dollars, however, the decision maker is able to bring social, environmental, and aesthetic concerns into the analysis. The authors believe that the applicability of PROTRADE to realistic problems is feasible. (Paylore-Arizona)

A NONSTRUCTURAL APPROACH TO CONTROL SALT ACCUMULATION IN GROUND WATER,
California Univ., Davis. Dept. of Civil Engineering.
O. J. Helweg.
Ground Water, Vol. 15, No. 1, p 51-57, January-February 1977. 9 fig, 1 tab, 6 ref. OWRT A-060-CAL(1).

Descriptors: *Groundwater, *Water pollution, *Salts, *Irrigation, Salinity, Wells, Water wells, Irrigation wells, Aquifers, Dissolved solids, Water quality, Leaching, Groundwater recharge, Seepage, Infiltration, Agriculture, *Groundwater protection, Groundwater salinity.

One of the more subtle and dangerous areas of pollution is that occurring in groundwater from normal irrigation practices. The pollution from salt buildup is presently one of the unsolved problems in managing stream-aquifer systems. This paper presented several strategies that offer a possibility of controlling salt buildup. For example, instead of applying irrigation groundwater near the site of a well, the ASTRAN Method, described herein, transfers it downstream to be applied on land where the groundwater is a lower quality, thereby controlling the increase in salt concentration. Instead of preventing seepage loss in delivery canals, the percolating water is used to maintain groundwater quality. Finally, timed releases of return flow remove salts, without exceeding surface water quality constraints. (Sims-ISWS)

MODEL AIDS MANAGERIAL EFFECTIVENESS IN MUNICIPAL WATER SYSTEMS,
Mississippi Water Resources Research Inst., Oxford.
K. W. Hollman, E. E. Milam, J. H. Sellers, R. F. Bush, and J. F. Hair, Jr.
Water and Sewage Works, Reference edition, p R-114-R-125. April 1978, 7 tab. OWRT A-116-Miss(1).

Descriptors: *Municipal water systems, *Model studies, *Cost efficiency, Performance, *Planning, Debt, Depreciation, Controllable cost, Uncontrollable cost, Multivariate, Pumpage, Treatment costs, Distribution systems, Water supply, Water treatment, *Mississippi water systems.

The objective was to generate a multivariate analytical model, using data from 45 Mississippi water systems as an information base, that would provide answers to these questions: (1) What factors play a part in achieving greater proficiency in regulating operating costs, and (2) To what extent do these factors affect efficiency. The criterion (dependent) variable consists of average total cost (ATC) per gallon of water; the twenty-two predictor (independent) variables are divided into four major costs/operations categories. The model (primarily using multiple discriminant analysis) measures several cost factors at varying levels of cost per gallon of delivered water for the one-third of the systems that were most efficient, the one-third that were the next most efficient, and the one-third that were least efficient. It identifies those economic, demographic, and water-related factors that are most closely associated with efficient water firms. Findings of the study will enable water system managers to determine the prevailing standards of cost performance in the industry and to bring current performance in line with industry averages. Findings will also be helpful to regulatory authorities and others interested in the most efficient use of water resources.

HOW TO CONDUCT A WASTEWATER SURVEY: PART II - DEVELOPING WASTE STREAM PROFILES,
Burns and Roe Industrial Services Corp., Paramus, NJ.
A. S. Vernick.
Plant Engineering, Vol. 31, No. 16, p 77-80, August, 1977. 1 fig, 2 tab.

Descriptors: *Surveys, *Industrial wastes, *Water utilization, *Sampling, *On-site data collections, Management, Alternate planning, Treatment facilities, Waste water treatment, Pollutant identification.

Procedures for developing individual waste stream profiles as part of a waste water survey are presented. Flow characteristics and pollutant loading are cited as the two major components of waste stream profiles. Water budget analysis is suggested to evaluate a plant's water usage and to reveal trends, seasonal variations, and other information about the plant's water needs. A typical plant water balance for average water consumption and waste water flow in various phases of operation is presented. Various methods for field measurement of water flow are described and compared. A flow diagram for processes related to a survey of water and waste water utilization is presented. Various methods to determine the composition of pollutants as a part of a waste stream profile are discussed. Three types of field sampling, including grab sampling, simple composite sampling and flow-proportioned sampling, and the operation of automatic sampling devices are examined. Analytical aspecsts of a sampling program are discussed, including preparation, preservation, and integrity of samples as well as the use of an independent laboratory to verify company lab results. The definition of waste stream profiles is recommended for evaluations of alternative treatment processes and for the development of an effective waste water management program. EPORT OF WASTE SOURCE INVENTORY ND EVALUATION, DADE COUNTY, FLORDA.
nvironmental Protection Agency, Athens, GA. outheast Water Lab.
vailable from the National Technical Information ervice, Springfield, VA 22161 as PB-255 161, rice codes: A07 in paper copy, A01 in microfiche. ine 1971, 119 p, 5 tab, 3 fig, 11 append.

Descriptors: *Water pollution, *Waste water treatment, *Waste water(Pollution), *Water quality, *Biological oxygen demand, *Effluent, *Industrial wastes, Suspended solids, Chlorination, Sewage, Phosphorus, Coliforms, Surveys, Carbon, *Dade County(FL), *Atlantic Ocean, Flow meters, Removal efficiency, Average flow.

This is a report of a survey of 76 major and minor municipal wastewater treatment plants in Dade County, Florida, undertaken between November 1970 and February 1972 to judge their treatment efficiency, adequacy of bacterial disinfection, and effluent loading. Twenty-four-hour composite samples were collected from influent and effluent using automatic samplers. Laboratory analyses were conducted on influent and effluent for 5-day BOD, COD, total suspended solids, volatile suspended solids, total organic carbon, and settleable solids. Effluent samples were analyzed for nitrogen compounds, total phosphorus and chlorides. Daily grab samples of the effluent after chlorination were analyzed for chlorine residual, pH and total coliform bacteria. Temperature, chlorine residual and flow were determined in the field. Also included is an industrial waste inventory which locates and identifies significant industrial waste resources. Summary tables are presented showing average flow, population served, removal efficiency, type of treatment, destination of effluents, and remarks concerning each municipal WWT plant. For each industrial pollution source identified, the type of pollution problem, and status of the company's actions to rectify the problem, are reported. It was found that Dade County waters are being contaminated by municipal and industrial wastes and that 21% of municipal waste volume receives inadequate treatment, while 77% receives no treatment. A major recommendation is that a regional collection and treatment system to serve all waste sources in Dade County be in operation to ensure secondary treatment of all wastes, with removal efficiencies of not less than 90%, and with discharge of treated effluents to the Atlantic Ocean. W79-01834

REPORT ON THE QUALITY OF THE WATER OF THE JAMES RIVER, SOUTH DAKOTA, 1970.
Environmental Protection Agency, Denver, CO. Technical Support Branch.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-255 255, Price codes: A05 in paper copy, A01 in microfiche. Report SA/TA-10, November 1972, 78 p, 10 fig, 33 tab, 2 append.

Descriptors: *Water quality, *Water pollution, *Runoff, *Stream pollution, *Pollution(Water), Turbidity, Suspended solids, Phosphorus, Biological oxygen demand, Dissolved oxygen, Pesticides, Coliform, Rivers, Alkalinity, *South Dakota, *James River(SD), *Feedlots, Fish life propagation, *Survey data, *Dissolved gases.

The study reported in this document was undertaken to determine the pollutional contributions of the Sand Lake Migratory Waterfowl Refuge and the effect of agricultural practices on the water quality of the James River in South Dakota. The field study was divided into two phases, a spring or runoff study, and a summer or low flow study, both undertaken in 1970. The James River originates near Fessendon, ND and travels south about 710 miles to the Missouri River east of Yankton, SD. The greatest flow in the James usually occurs in March and April when snowmelt is greatest. Peak discharges are also experienced from May through June because of heavy rainfall. Annual low flows occur in late summer, autumn, and winter. The field laboratories conducting the study were located near the sewage treatment pumping station in Huron. The samples collected were 'grab' type and were taken at staggered times throughout the day. Samplers made field determinations for dissolved oxygen, temperature and pH, and collected water samples for other laboratory investigations. The laboratory determinations included 5-day BOD, dissolved oxygen, pH, conductivity, turbidity, suspended solids, alkalinity, and coliform, among others. Pesticide samples were also collected. The results of all bacteriological, chemical, and physical determinations are tabulated in the appendix. The contributions of the Sand Lake Migratory Waterfowl Refuge and agricultural practices to water quality could not be adequately assessed due to unfavorable stream and weather conditions. However, it was found that runoff from feedlots caused a significant decrease in the amount of dissolved oxygen and that BOD concentration also increased quite drastically as a result of feedlot runoff. The problems were exacerbated during low-flow periods. (Coan-NC)
W79-01837

OIL AND HAZARDOUS SUBSTANCES POLLUTION CONTINGENCY PLAN. REGION VIII. COLORADO, MONTANA, NORTH DAKOTA, SOUTH DAKOTA, UTAH, WYOMING.
Environmental Protection Agency, Denver, CO. Region VIII.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-255 280, Price code: A07 in paper copy, A01 in microfiche. November 1971, 132 p.

Descriptors: *Water pollution control, *Oil spills, *Water pollution sources, *Oil pollution, Hazards, Accidents, Fish, Federal government, State government, Local government, Colorado, Montana, Wyoming, North Dakota, South Dakota, Utah, *Contingency planning, Hazardous spills, Oil pollution removal, Regional planning, Personnel, Public administration.

This report is a compilation of agencies and organizations, both federal and state, responsible for coordinating reactions to an oil spill or spills of other hazardous substances occurring in the navigable waters of Region VIII. The regional contingency plan of Region VIII follows the general format of the national contingency plan. In the event of an oil spill or large fish kill, the EPA is notified and takes the necessary first steps. A Regional Spill Emergency Team is formed; its functions are to investigate the spill and report possible federal statute violations, provide needed resources, conduct ecological surveys and investigations, coordinate personnel from other agencies and notify all affected jurisdictions. The geographic boundary of Region VIII is described, along with major navigable waters. Informational data are listed for all government agencies and private firms involved when spills of hazardous substances occur. (Coan-NC)
W79-01842

ENVIRONMENTAL ASSESSMENT OF WATER QUALITY MANAGEMENT PLANS.
Environmental Protection Agency, Washington, DC.
January 1977, 112 p. 68-01-3195.

Descriptors: *Water quality management, *Air pollution, *Environmental effects, *Land use, *Economic impact, *Social impact, *Planning, Data collection, Employment, Runoff, Water supply, PL92-500, *Regional impact assessment, *Ecological impact, *Impact assessment, 208 areawide plans, Critical land areas.

This report is designed to assist managers and staff of planning agencies in assessing the natural and man-made environmental impacts of their recommendations for alternative water quality management (WQM) plan elements. The function of these plan elements is to improve the physical environment in accordance with minimum levels of waste treatment technology as required by PL92-500. This handbook focuses on key assessment questions in the areas of water quality and quantity, land use, air quality, ecological quality, economics, visual quality, and other social impacts. Impacts, impact measurements and data needs are presented, and important questions arising from an impact assessment study are discussed. Each step of the process, from identifying problems in meeting water quality goals, to the selection of an areawide plan, is tied to assessing its impact on the environment. The

handbook sets out several steps when marking an environmental assessment and shows the relationship of the environmental assessment process to the planning process. The environmental assessment steps include identifying community goals and objectives relating to environmental considerations; assessment of possible environmental effects and collection of data; a detailed environmental assessment of alternative plans; development of possible mitigration measures and soliciting public involvement to determine the significance of environmental effects in relation to community goals and objectives; decisions on environmental impacts; and finally, at the time of the areawide WQM plan is selected, documentation of the assessment. (Coan-NC)

COMPREHENSIVE WATER QUALITY MANAGEMENT FOR THE STATE OF SOUTH DAKOTA. 303(E) BASIN PLAN FOR THE MINNESOTA RIVER BASIN.
South Dakota Dept. of Environmental Protection, Pierre.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-268 417, Price codes: A08 in paper copy, A01 in microfiche. 1976, 161 p, 25 tab, 4 graph, 2 fig, 7 append.

Descriptors: *Water quality management(Applied), Water quality, *Planning, *Water pollution, *Water pollution control, Regulation, Water quality standards, Effluent, Discharge, Wastes, Organic wastes, Dissolved solids, Suspended solids, Non-point source pollution, *South Dakota, *Minnesota River Basin, 303(e) Basin Plans, Regional planning, Turbidity.

This report presents South Dakota's strategy for correcting water pollution, thereby improving and maintaining water quality in the Minnesota River Basin. The Basin drains approximately 1,572 square miles in portions of six counties. There are currently three active Water Quality Monitoring (WQM) stations in the Basin. The Basin has generally high quality water but downward sloping topography with resulting erosion is causing some sedimentation and eutrophication problems. The proposed Whetstone River Diversion Project should help reduce these problems. The report inventories point source discharge resulting from municipal, industrial, and agricultural sources and includes tables describing the receiving waters, effluent limitations, type of treatment, and their compliance with water quality standards. The contributors to non-point source pollution are streamside grazing, overgrazing, and natural soil erosion which add organic and inorganic loadings to the waterways. Urban non-point source pollution is not a problem. Several types of monitoring and surveillance activities are conducted annually in the Basin, including operation and maintenance inspections of wastewater treatment (WWT) facilities, compliance monitoring, and inspections of problem feedlots. The main strategies for improving water quality in the Basin consist of erosion control measures, increased cooperation between relevant governmental agencies, increased research and control of non-point source pollution, establishing more WQM stations, and lowering the maximum suspended solids criterion to a maximum of 70 mg/l. (Coan-NC)
W79-01846

INNOVATIVE MANAGEMENT CONCEPT FOR 208 PLANNING,
Michigan Univ., Ann Arbor. Civil Engineering and Natural Resources.
J. W. Bulkley, and T. A. Gross.
Journal of the Water Resources Planning and Management Division (ASCE), Vol. 103, p 227-239, November 1977. 4 fig, 16 ref.

Descriptors: Water resources, *Planning, *Management(Administrative), *Water law, Water use, Water quality, Economics, Legislation, Water, *Thames Water Authority, *208 Planning, *Regional water resource planning, Management reorganization, Financial sources, State laws, Federal laws, Efficiency.

This article addresses the organizational problems arising from the implementation of 208 area-wide water quality planning programs. Criteria have been developed to provide a basis for evaluation of the organizational arrangements by which water services are provided in complex urban areas. These criteria are: the organizational arrangements should include the means for resolving conflicts among all users of water in the region; efficient use should be made of all resources in the provision of water services; financial sources should be adequate and flexible; river basins should be recognized as the units most appropriate to the management of water resources; agencies should be free to employ a wide range of techniques in accomplishing their goals; agencies should be accountable to the entire population served and responsive to its needs and desires; the organizational arrangements for water services should be compatible with the overall government structure; costs and benefits should be distributed equitably throughout the whole region. A short discussion and rationale is provided for each criterion. The Thames Water Authority management structure was described as a possible model for reorganization of U.S. water resource planning. This Water Authority incorporated many previously autonomous water functions under one organizational structure. Decisions were obtained more rapidly, tighter control over the planning process was realized, the reorganization provided the opportunity of all divisions to draw upon the resources of the Authority as a whole, and other benefits were realized. The report concludes with recommendations on how to develop alternative water resource management schemes. (Coan-NC)

ADSORBENT PROCESS FOR OILY MATERIALS,
Daicel Ltd., Sakai (Japan). (Assignee).
A. Zenno, T. Uebayashi, I. Maruyama, and H. Shiono.
U.S. Patent No. 4,102,783, 11 p, 13 tab, 2 ref; Official Gazette of the United States Patent Office, Vol 972, No 4, p 1614, July 25, 1978.

Descriptors: *Patents, *Oil pollution, *Water pollution treatment, *Water quality ontrol, Adsorption, Floating, Separation techniques, Cotton, Fibers(Plant).

An adsorbent used for effectively collecting or removing oily materials floating on water or emulsified or dispersed in water is composed mainly for unrefined lints or unrefined linters together with, if necessary, filter papers, synthetic fibers or natural fibers. These materials are mainly formed into a mat, a strand, etc, or can be used in the form of a fixed bed or a fluidized state. The lints are the long fibers recovered first from cotton seed using a cotton gin and are formed into spun yarns and fabrics in a fibrous state using a cotton system spinning machine. However, the cotton seed from which the lints have been recovered further contains short fibers which can also be recovered and they are called linters. (Sinha - OEIS)

APPARATUSES TO SEPARATE MIXTURES OF LIQUIDS OF DIFFERENT SPECIFIC GRAVITIES,
Machinefarbiek Geurtsen Deventer, NV. (Netherlands). (Assignee).
A. A. Geurtsen.
U.S. Patent No. 4,102,787, 5 p, 1 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 972, No 4, p 1615-1616, July 25, 1978.

Descriptors: *Patents, *Oil pollution, *Oily water, *Water pollution treatment, *Water quality control, Separation techniques, Specific Gravity, Ballast water, Gravity separation.

An apparatus to separate a mixture of liquids of different specific gravities, e.g. oil and water, comprises a closed vessel containing a separation space, an upper chamber situated above the separation space, a partition mounted for vertical movement between a lowest and a highest position to control regulating and/or signalling device. The partition separates the upper part of the separation space from the upper chamber. The vertically movable partition provided between the separation space and the upper chamber is a diaphragm or a bellows which is attached to the wall of the vessel in a liquid tight manner. A collecting chamber for the heavier liquid is situated under the separation space and is provided with a discharge conduit. (Sinha-OEIS)

HYDRO-CARPET OIL SPILLAGE CONTAINMENT AND RECOVERY DEVICE,
Amerada Hess Corp., Woodbridge, NJ. (Assignee).
R. W. Young.
U.S. Patent No. 4,102,789, 5 p, 7 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 972, No 4, p 1616, July 25, 1978.

Descriptors: *Patents, *Water pollution control, *Water quality control, *Oil spills, *Oil pollution, Barriers, Obstruction to flow, Equipment, Absorption.

A hydro-carpet apparatus is primarily for providing an emergency containment potential for small oil spills. These spills may result from transferring petroleum products either from a land based supply on shore to a vessel or vice versa. The invention is so arranged that its components can be positioned and placed in a usable state by a single workman without the assistance of additional personnel or by the use of any mechanical equipment. The invention comprises a wheeled container which is placed downstream at the edge of a dock or bulkhead from the point at which the transfer is to take place. The arrangement is so conceived that in the event of a spill a messenger line is pulled smartly, thus tripping the container door and, from this, making it possible to release a carpet roll previously stored in the container so that it can be almost instantly pulled out of the container in such fashion that is balls to the water surface after being unreeled. The carpet contained within the container is formed of surbent material which will temporarily contact and contain, as well as either adsorb, or absorb oil products. (Sinha-OEIS)

OIL SPILL RETRIEVAL SYSTEM,
J. J. Janson.
U.S. Patent No. 4,105,554, 7 p, 3 fig, 9 ref; Official Gazette of the United States Patent Office, Vol 973, No 2, p 738, August 8, 1978.

Descriptors: *Patents, *Oil spills, *Oil pollution, *Water pollution treatment, Water quality control, Separation techniques, Boats, Monitoring, *Oil recovery.

The invention provides an oil spill retrieval system including apparatus for collecting the oil from the surface of a body of water and for processing the collected oil to remove the water collected with it and to return the cleaned water back to its source. The system includes a boat which carries the collecting and processing apparatus. The significant feature is not processing to provide clean oil but rather processing the mixture so that the removed oil has a minimum of water content to reduce the volume required to be stored until the boat can unload. The other significant feature is to process the removed water until its contaminant level

h oil) is low enough to permit its discharge
to its source. (Sinha-OEIS)

v Hampshire Research Report No. 17, 1978. 46
fig, 10 tab, 32 ref, 3 append. OWRT A-038-
(2).

criptors: *Economic impact, *Environment,
ganic loading, *Water quality, *Phosphorus,
luation, Mathematical models, Linear pro-
nming, Lakes, Lake shores, Recreation, Land
elopment, Economics, *New Hampshire, Al-
ative land development, Phosphorus loading,
mmercial developments, Residential develop-
ts.

overall objective was to evaluate alternative
developments around New Hampshire lakes.
analytical method used was based on a combi-
on of a mathematical programming model and
hosphorus nutrient budget model. Alternative
elopment patterns, evaluated by their impacts
the lake area environment and area economy,
uded residential patterns, commercial patterns,
combinations of these two types. Economic
act from each alternative development was
sured in terms of net public revenue and total
ate expenditures to the local area, to the State
to other states. The impact of the alternative
elopments on the lake area environment was
sured in terms of crowding levels and the level
hosphorus concentration in the lake. Phospho-
loading of the lake water was used as a proxy
able to reflect the changes in the lake water
lity. Commercial developments yielded the
est revenues to the town and local areas. It
attracted the most lake users to the area as
l as contributing the largest phosphorus loading
he lake waters. Residential developments, al-
ugh contributing high total revenues to the
, yielded less net revenue to the town. Phos-
rus loading levels from residential develop-
ts were much lower than lake phosphorus
ding by commercial developments.

RECLAMATION OF POLLUTED FARM PONDS,
Louisiana Tech Univ., Ruston. Coll. of Engineering.
J. D. Nelson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-277 807, Price codes: A04 in paper copy, A01 in microfiche. M.S. Thesis, May, 1977. 78 p, 8 fig, 12 tab, 22 ref, 7 append. OWRT B-008-LA(1). 14-31-0001-5078.

Descriptors: *Eutrophication, *Lake restoration, *Nutrient inactivation, *Sediment sealing, *Farm ponds, *Water quality, Nutrient cycling, Clay soils, Aquatic ecology, Lakes, Reservoirs, Impoundments, Nutrients, Pollutants.

The objective was to determine if the application of clay soils to nutrient-rich pond water would be effective in reclaiming the usefulness of eutrophic farm ponds. Clay particles were to serve as a nutrient inactivant and bottom sediment sealant. Pond water was isolated (in situ) with polyethylene columns. Three clay soil types were used at three application rates on four sites of 12 columns each within the pond: nine columns for the different treatments and three control columns. Three sites were treated in July and the fourth in February. Water samples were taken from the columns and the pond before and after treatment. Samples were analyzed for various water quality parameters to determine the effectiveness of each treatment. Results indicated that under the experimental conditions of this study, application of clay soil within columns in the summer did not effectively reduce productivity or limit nutrient availability. Visual observations of pond productivity indicated that the winter treatment was more effective. It is suggested that clay not be eliminated from consideration as a nutrient inactivant, but further study should be initiated to determine the effects of season of treatment.

6. WATER RESOURCES PLANNING

6A. Techniques Of Planning

SEQUENCING COMPETITIVE EXPANSION PROJECTS,
California Univ., Los Angeles. Graduate School of Management.
D. Erlenkotter, and J. S. Rogers.
Operations Research, Vol. 25, No. 6, Nov.-Dec., 1977, p. 937-951. 1 fig, 21 ref. (California Water Resources Center Project UCAL-WRC-W-474). OWRT B-170-CAL(6).

Descriptors: *Model studies, *Mathematical studies, Economics, *Mathematical models, *Optimization, *Investment, Planning.

A solution approach is developed for finding the sequencing of a finite set of capacity expansion projects that minimizes total discounted operating and investment costs. Variable operating costs are specified through a general continuous-time function that requires projects to be competitive in a certain sense. This definition for operating costs allows the use of an optimization submodel, such as a multilocation distribution problem, to determine operating decisions. The general formulation includes several simple sequencing problems as special cases. The solution approach afdresses a relaxed problem formulation that incorporates economic criteria for determining project timing decisions, and it is shown that properly defined solution to the relaxed formulation solved the original problem. Several refinements to the basic solution approach are also developed. (Snyder-Calif, Davis)

ENERGY RESOURCES DEVELOPMENT IN WYOMING'S POWDER RIVER BASIN: AN ASSESSMENT OF POTENTIAL SOCIAL AND ECONOMIC IMPACTS,
Wyoming Univ., Laramie. Water Resources Research Inst.
R. A. Matson, and J. B. Studer.
Prepared for Northern Great Plains Resources Program by the Wyoming Water Resources Research Institute in cooperation with the Economic Research Service, U.S.D.A., May 1974. xviii + 152 p, 2 fig, 65 tab, 10 ref, 4 append.

Descriptors: *Wyoming, *Population growth, *Economic impact, *Social impact, *Employment, Distribution patterns, Manpower, Industrial production, *Energy development, *Powder River Basin(Wyo), Campbell County(Wyo), Crook County(Wyo), Niobrara County(Wyo), Converse County(Wyo), Johnson County(Wyo), Sheridan County(Wyo), Natrona County(Wyo), Weston County(Wyo).

Development of the coal and uranium reserves of Wyoming's Powder River Basin, which includes 8 counties in the northeast corner of the state, will generate within a decade sharp increases in employment and population, much of it through the in-migration of relatively young, highly paid workers. Projections of population, employment, and settlement patterns to the year 2000 are made, based on four possible scenarios. Three of these (minimal, intermediate, and extensive coal development) were established by the Northern Great Plains Resources Program (NGPRP); the fourth was developed to accommodate Wyoming's Department of Economic Planning and Development data. Included are a survey of existing literature

and current research, development alternatives, impact estimates, implications of each scenario, and a consideration of the need for further research.

SUMMER DISTRIBUTION AND REPRODUCTIVE STATUS OF FISH OF THE COLORADO RIVER IN GRAND CANYON NATIONAL PARK AND VICINITY, 1975,
Northern Arizona Univ., Flagstaff. Dept. of Biological Sciences.
C. O. Minckley, and D. W. Blinn.
Final Report No. CRRP-14, June 1976. 17 p, 2 fig, 3 tab, 18 ref. CX821060008.

Descriptors: *Fish populations, *Fish reproduction, *Conservation, *Colorado River, National Parks, Aquatic life, Surveys, Fish types, Ecology, Fish conservation, Bonytail chub, Habitats.

A survey was conducted during the summer of 1975 on the summer distribution and reproductive status of fish in the Colorado River and its tributaries. Ten species were collected, four native and six exotic, and reproduction was verified in all native fish and three exotic species by collection of juvenile forms born that year. All the native fish except the bonytail chub were common varieties and were more abundant in total numbers and localities collected than exotic varieties. However, exotic fish were distributed throughout the system. Although competitive interaction between native and exotic fish generally results in the eventual extirpation of native fauna or a drastic reduction in numbers, it appears that most species of native fish in this area are holding their own and are at levels similar to those of 1968. All fish were examined for ectoparasites and found to be negative. Recommendations are included pertaining to further research and providing information to visitors on endangered species present in the Grand Canyon National Park. (Majtenyi-IPA)

ELITE ATTITUDES TOWARD MARSHLANDS IN SOUTH CAROLINA,
South Carolina Sea Grant Program, Charleston.
E. O. Kline, F. Petrusak, and W. Moore.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-270 208, Price codes: A03 in paper copy, A01 in microfiche. South Carolina Sea Grant Technical Report No. SC-SG-77-5, May, 1977. 29 p, 16 tab, 1 append.

Descriptors: *Marshes, *South Carolina, *Attitudes, Wetlands, Surveys, Land use, Swamps, Atlantic Coastal Plain, Decision making.

Survey research conducted in late 1973 and early 1974 was used to ascertain the attitudes of the elite of South Carolina's coastal counties towards marshlands. Included in the 'elite' are politicians, interest group leaders, and other residents involved and interested in the use of the marsh. Elites were knowledgeable about the marshland and were aware of key marsh-related issues. Development and use of marshland should be regulated by the government according to respondents; forty-five percent believe that the government should directly own and control the marshland. Zoning and leasing permits, two instruments of government regulation, were strongly supported. Fifty-five percent of the elite rated conservation and aesthetic use of marshes at first or second priorities for the future; commercial use was given a much lower priority. Among all of the problems confronting the state, however, respondents do not believe preservation and controlled development of the marsh are among the most important. (Stihler-Mass)

LOUISIANA METROPOLITAN WETLANDS: A PLANNING PERSPECTIVE, A REPORT TO THE LOUISIANA STATE PLANNING OFFICE,
New Orleans Univ., LA. Urban Studies Inst.
A. J. Mumphrey, Jr., E. J. Durabb, W. B. McCrocklin, Jr., S. T. Halperia, and S. D. Villavaso.
October, 1975. 232 p.

Descriptors: *Wetlands, *Land use, *Louisiana, *Cities, *Marsh management, Decision-making, Social aspects, Urbanization, Zoning, Developed waters, Land development, Water pollution effects, Economics, Metropolitan wetlands, Wetland development.

Information is gathered from various sources concerning wetlands and their relationships to metropolitan areas and a decision-making framework is presented for wetland development. In chapter one, wetlands are defined and a general description of Louisiana's wetland Standard Metropolitan Statistical Areas (SMSA) are given. The second chapter examines wetland zoning and master land use plan projected wetland development for each SMSA. Chapter three focuses on the impacts of metropolitan development in wetlands in terms of pollution, reclamation, and channelization. A per acre monetary evaluation on the basis of noncompeting wetland component functions and wetland energetics is given in chapter four. Private and public construction and maintenance costs in wetland areas are considered in chapter five. Projections of future metropolitan land space requirement and location of activities are discussed in chapter six. Chapter seven discusses impacts in a framework of development decision making which includes comprehensive costs and benefits, com
munity goals, and distribution effects. Chapte
eight presents a comprehensive planning proce
leading to wetland development or nondevelop
ment and also points out areas of future researc

CONSUMER ATTITUDES TOWARD TAST AND ODOR IN WATER,
California Univ., Berkeley. School of Publ
Health.
W. H. Bruvold.
Journal American Water Works Association, O
tober 1977, p 562-564. (California Water Resourc
Center Project UCAL-WRC-W-359).

Descriptors: *Water quality, *Taste, *Odor, *Att
tudes, Social values, Social perception, Consum
attitudes.

The rationales behind several approaches to inve
tigating consumer perception of taste and odor
water are explored. The analysis suggests that tw
of four categories of taste and odor would b
governed best by limits and two would best b
governed by grades - the major determinant bein
the pleasantness or desirability of just perceptib
concentrations. Consumer-panel research woul
produce better limits as standards. Both types
research need further development and refineme
before a full range of perceptual standards can b
recommended with confidence. Enough progre
has been made in consumer and in threshold r
search to encourage further work on both towar
attaining the best possible perceptual water quali
for all consumers. (Snyder-Calif, Davis)

interim report is preliminary to the 71 publi-
on of the Wabash River comprehensive plan,
the Wabash River and tributaries in Indiana,
ois and Ohio. Studies on the three reservoir
cts recommended in this plan had progressed
he point where their construction had been
ned desirable and this report was prepared as a
cle for the possible authorization of these pro-
. The report reviews economic development,
eorology and hydrology, water resources prob-
and needs, considered solutions, reservoir
s, cost allocations, local cooperation and inter-
cy coordination. The report proposes devel-
ent of Lincoln Reservoir on Embarrass Creek
llinois, Clifty Creek Reservoir on Indiana's
y Creek and Patoka Reservoir on Patoka
r in Indiana. Each reservoir is multi-pupose,
rding flood control, water-associated recrea-
and providing new fisheries. Additionally,
Lincoln and Patoka Reservoirs would pro-
needed storage for water supply and improve-
t of downstream water quality. For each Proj-
benefits exceed costs with ratios ranging from
to 1.6:1. The projects have been endorsed by
l governments, and public agencies; however,
l individuals and interests whose properties are
lved in land acquisition or damage considera-
generally oppose the projects. (Zayac-NC)

volume is part of the interim report published
r to the 1971 publication of the Wabash River
prehensive plan for the Wabash River and
taries in Indiana, Illinois an Ohio. Three reser-
s are recommended in the interim plan: Lin-
Reservoir on Embarrass Creek, IL; Clifty
k Reservoir and Patoka Reservoir, IN. Ap-
dix A is comprised of two sections: the first is a
iled estimate of first costs and annual costs; the
nd reviews Area Redevelopment Act (ARA)
cts. The first section is a series of tables, with
of the three projects' costs first summarized,
owed by detailed estimates of first costs and
ual costs. The second section reviews labor
s; operation and maintenance costs; population;
loyment and unemployment; and skilled
ker effects resulting from the implementation
RA. Appendix B reviews economic develop-
t and estimates of damages and benefits that
ht result from the construction of the three projects. An economic history of the Wabash River Basin is presented, development differences between the White and Wabash Basins are discussed, population and projected growth and distribution in the Wabash Basin are outlined and development trends reviewed. Appendix C assesses cost allocation and apportionment. The allocation of costs between purposes is explored. Investment costs, annual costs and alternate costs are inventoried. This is followed by the apportionment of costs between federal and non-federal interests in such categories as flood control, water supply, water quality control, fish and wildlife and recreation. (Zayac-NC)

INTERIM REPORT NO. 2, WABASH RIVER BASIN COMPREHENSIVE STUDY COVERING RESERVOIR SITES ON EMBARRASS RIVER, IL., AND CLIFTY CREEK AND PATOKA RIVER, IN. VOL. III, APPENDICES D-F.

Army Engineer District, Louisville, KY.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A036 533, Price codes: A99 in paper copy, A01 in microfiche. January 1964, 641 p, Appendix D: Hydrology and Hydraulics; Appendix E: Geology, Soils and Materials; Appendix F: Reports of Other Agencies. See also Vols. I and II.

Descriptors: *Hydrology, *Hydraulics, *Multiple-purpose reservoirs, *Geology, *Comprehensive planning, *Water resources development, Indiana, Illinois, Geohydrologic units, Hydrologic aspects, Hydrologic budget, Hydrologic cycle, Hydrologic data, Permeability, Drainage, Flood control, Limnology, Precipitation(Atmospheric), Runoff, Spillway gates, Streamflow, Watersheds(Basins), Engineering geology, Geologic foundations, Geomorphology, Topography, Sedimentation, Recreation, *Wabash River, *Embarrass River(IL), River basin development.

This volume is part of the interim report published prior to the 1971 publication of the Wabash River comprehensive plan for the Wabash River and tributaries in Indiana, Illinois and Ohio. Three reservoirs are recommended in the interim plan: Lincoln Reservoir on Embarrass Creek, IL.: Clifty Creek Reservoir and Patoka Reservoir, IN. Appendix D Surveys the hydrology and hydraulics of each site both before and after the expected construction of each project. Included are flow data at the dam sites, unit hydrographs at selected points on the rivers to be impounded, tailwater rating curves, area and capactiy of the reservoirs, standard project storms and floods, plans for water supply and water quality storage, flood control and regulation, engineering reviews of outlet works and spillways, runoff data and frequency curves outlining natural discharge, natural stages and modified stages. Appendix E reviews the geology, soils and materials of each of the three projects. Features of each site are discussed: physiography, regional geology, bedrock structures, groundwater conditions, foundation explorations, and conditions of preliminary and final site selection, embankments and sources of construction materials. Appendix F is comprised of 10 reports from other agencies. Agencies submitting reports are U.S. Dept. of Agriculture Soil Conservation Service and Forest Service; U.S. Dept. of Interior Geological Survey, Fish and Wildlife Service, Bureau of Outdoor Recreation, Bureau of Mines; U.S. Dept. of Health, Education and Welfare Public Health Service; the Federal Power Commission; City of Charleston, IL.; and Indiana Flood Control and Water Resources Commission. These include groundwater appraisals, geological maps, reports on recreation resources and fish and wildfife resources and water resources and water resources study for the various reservoir projects. (Zayac-NC)

WABASH RIVER BASIN COMPREHENSIVE STUDY. VOL I. MAIN REPORT,

Available from the National Technical Information Service, Springfield, VA 22161 as AD-A036 536, Prepared by U.S. Army Corps of Engineers, Louisville District, for Wabash River Coordinating Committee, (Ill-Ind-Ohio), 1971, 266 p, 97 tab, 128 fig, 2 attachments.

Descriptors: *Water resources development, *Water resources, *Planning, *Comprehensive planning, Illinois, Indiana, Ohio, Water reuse, Water policy, Water quality, Monitoring, Natural resources, Land resources, Water rights, Economic, Regional analysis, Social impact, Environmental impact, Geology, Topography, Physiographic provinces, Climate, Hydrology, Water supply, Navigation, Programs, Flood control, Ground water availability, *Wabash River Basin planning.

The Objective of this study is to identify, evaluate and propose a water and land resource plan for the Wabash River and its tributaries in Indiana, Illinois and Ohio. Four basic planning elements--economic, regional, environmental and social--are addressed in the study in order to accommodate the best balance of interests in a solution to the water problems and needs of the people of the Wabash River Basin. In this main report, physical characteristics of the basin are described, including geology, physiography, topography, land resources, climate, hydrology and environmental features. The economic environment is discussed in terms of current economic patterns and activities and the projected economy. The status of water and related land resources availability, development, programs and planning are assessd. Problems and needs in flood control, water supply, electric power, water quality, environmental resources and navigation are studied. A background to the formulation of the comprehensive plan is provided, followed by a description of the comprehensive plan. Here, the plan is first described in general terms. Then each plan feature and its short- and long-run implications are scrutinized. Lastly, effects for each subbasin are reviewed. A summary evaluation conducted for each problem (or need) outlined above. Implementation is discussed, followed by conclusions and specific recommendations for water quality, ground water use, water reuse and water quality monitoring. Policy and legislative suggestions are provided and recommendations for plan implementation are outlined. (Zayac-NC)

A LAND STUDY FOR DOWNTOWN LAKE CHARLES,

Houston Univ., TX. Coll. of Architecture.
B. C. Webb, D. Herring, and J. Harrison.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-271 477, Price codes: A03 in paper copy, A01 in microfiche. Prepared for Lake Charles-McNeese Urban Observatory, Inc., Lake Charles, LA, Spring 1977, 21 p.

Descriptors: *Urban land use, *Architecture, *Urban planning, *Planning, Recreation, Community development, Land development, *Lake Charles(LA), Commercial structures, Public amenities, Infrasture.

This study investigates the factors that will help determine the most appropriate use and development pattern for a section of publicly-owned waterfront property located within the city of Lake Charles, LA. The factors include the morphological features of the city, activity patterns, and an assessment of the city's building process. The report explores the use potential of the site in terms of the related activity patterns in the area as well

as structuring concepts for integrating site development with the existing city fabric and effective use of the attractive site features. The present tract is undeveloped except for a narrow band of landscaping adjacent to the Lake Shore Highway, a major thoroughfare running along the edge of the site. The site is well located in relation to the major activity centers of the central city, with good visibility and access from entry roads, and is located close to a major civic center. The report offers several different uses for the site and evaluates these uses in terms of overall compatibility within the city's context. The three general land use concepts discussed are a waterfront park, uses related to the Civic Center and uses related to the tourist traffic. The major conclusion of the report is that the infrastructure should be built first, followed by the development of the public amenities and facilities, and lastly, the building of commercial structures. The development plan should be flexible enough to provide for changing circumstances. (Coan-NC)

ILLINOIS COASTAL ZONE MANAGEMENT PROGRAM, 2ND YEAR WORK PRODUCT, VOL. VI. PUBLIC PARTICIPATION ACTIVITIES BY LEAGUE OF WOMEN VOTERS, NORTHEASTERN ILLINOIS PLN. COMMISSION, LAKE MICHIGAN FEDERATION.
Illinois State Dept. of Transportation, Springfield. Div. of Water Resources.
Sponsored by NOAA, Office of Coastal Zone Management, Washington, D.C., September 1976, 102 p, 3 append.

Descriptors: Water resources, *Coasts, *Illinois, *Management, Planning, Political aspects, *Lake Michigan(IL), *Coastal Zone Management, *Public participation, Resources management.

This report is a compilation of second-year citizen participation activities and their influence on the Illinois Coastal Zone Management Program for Lake Michigan. The three organizations responsible for involving the public in the planning process were: the Lake Michigan Inter-League Group of the League of Women Voters (LWV); the Northeastern Illinois Planning Commission; and the Lake Michigan Federation. Included in the activities sponsored by the League of Women Voters are descriptions of each of the 12 public education and input meetings scheduled by local Leagues, the publicity developed by each of these Leagues, the methodology used at each meeting, and the results of the citizen comments elicited at each meeting. Also included are explanation of the rationale and procedures involved in the distribution of packets of information to area libraries prior to each scheduled meeting. The Northeastern Illinois Planning Commission's function was to facilitate communication between the public and officials in the Coastal Zone Management Program. Their activities included conducting a training session for all public meeting facilitators; preparing three identical library displays keyed to LWV-sponsored public meetings; and providing the staff evaluation and consultation on group interaction methods for effective participation. Descriptions of the Lake Michigan Federation activities included their public workshops on Coastal Zone Management, publishing of a report (Lake Michigan Current), and monitoring staff and citizen attitudes about the Program. Each organization has provided an analysis of the success of their undertakings. (Coan-NC)

FACTORS AFFECTING THE USE OF AN ARTIFICIAL BEACH: A CASE STUDY ON MISSISSIPPI GULF COAST,
University of Southern Mississippi, Hattiesburg. School of Business Administrations.
C. P. Cartee, and D. C. Williams, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-289 393, Price codes: A04 in paper copy, A01 in microfiche. Report, October 1978. 59 p, 2 fig, 16 tab, 16 ref. OWRT A-109-MISS(1). 14-34-0001-8026.

Descriptors: *Beaches, *Recreation standards, *Recreation demand, *Artificial beaches, Harrison County(Miss), *Mississippi, Pass Christian(Miss), Long Beach(Miss), Gulfport(Miss), Biloxi(Miss).

The purpose was to provide basic data relative to the utilization of the 26-mile, man-made beach in Harrison County, Mississippi, and to determine factors related to beach use. More specifically, the project was purposed with quantifying the level of beach usage by delineated zones at selected periods of the year; determining the characteristics of users and factors prohibiting or encouraging their use of the beach; appraising consumer perception of water quality and its relationship to beach usage; and reviewing the various legal, political and jurisdictional factors affecting the future development and use of the resource. Procedures involved random counts of beach usage by delineated zones and personal interviews with beach users. Marked variations were found in beach usage among zones and periods of the year. In terms of carrying capacity criteria the beach was well below its potential. A significant difference was found between resident and non-resident perceptions of beach water quality while no significant difference was found in activity usage of the beach between the two groups. Lack of public conveniences on or contiguous to the beach was noted by the two groups. Lack of public conveniences on or contiguous to the beach was noted by the two groups. Lack of public conveniences on or contiguous to the beach was noted by interviewees most often as factors detracting from their beach recreational experience.

AN UNOBTRUSIVE MEASURE OF THE RECREATIONAL VALUE OF A LAKE,
Augusta Coll., GA.
W. D. Spears, and R. R. Criss.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-289 363, Price codes: A02 in paper copy, A01 in microfiche. Water Resources Research Institute Bulletin 27. Auburn University, Alabama, April 1977. 16 p, 2 fig, 2 tab. OWRT B-037-ALA(2).

Descriptors: *Lakes, *Recreation, Socio-economic value, *Alabama, *Social value, *Social participation, Measurement.

Data from a study of an Alabama lake was used to demonstrate that separate measures of rated values of a facility for various recreational activities, and reports of participation in those activities, are functionally related to a high degree. A simple unobtrusive measure, obtainable by a 'nose count' by an observer or from daily records maintained in some facilities, may provide the equivalent of information regarding one kind of social value usually obtained by unwieldly questionnaires. The measures developed in this study may well overcome a crucial problem present in questionnaire studies. What can be concluded if the percent of respondents is low. This study concluded that percents of participants engaged in various activities can validly indicate perceived worth of the site for those activities. Careful accounting would require original calibration of the percentage measure against a scale of value, but once obtained, non-obtrusive measures would permit monitoring of recreational value of a site as it changed with conditions, expenditures, etc.

WATER SUPPLIES AND COSTS IN RELATION TO FARM RESOURCE DECISIONS AND PROFITS ON SACRAMENTO VALLEY FARMS,
California Univ., Davis. Dept. of Agricultural Economics.
T. R. Hedges.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-289 688. Price codes: A06 in paper copy, A01 in microfiche. Giannini Foundation Research Report No. 322, June, 1977. 90 p, 12 fig, 14 tab, 37 ref, append. (California Water Resources Center Project UCAL-WRC-W-111). OWRT B-008-CAL(3) and B-068-CAL(2).

Descriptors: *Economics, *Water requirements, *Decision making, Management, Groundwater, Water management(Applied), Resource allocations, Model studies, *Crop production, *Tomatoes, *Sacramento Valley(Calif), Irrigation water use, Water supply, *Cost analysis, California.

This summary of research on two 640-acre general-crop farm models in the Southern Sacramento Valleys, Yolo County, examines the economic impacts of variations in water quantities and costs on farm profits. This second study (see also W74-11568) in the Sacramento Valley irrigation economics series considers two analysis models: The high productivity soils unit includes Storie Index Grades I and II soils; the soils for the medium productivity unit are predominantly Storie Index Grade III, but range into Grade IV. Maximum potential water quantities available for the analysis models in this study total nearly 2,800 acre-feet, according to the number of wells and their potential pumping capacity. Water prices were approximately $2.50 to $3.00 per acre-foot, depending on quantities pumped, for variable expenses only, or a total of about $7.00 to $9.00 per acre-foot for variable expenses and fixed costs combined. The study analyzed three general crop irrigation practices: (1) reirrigating when the depletion percentage for available soil moisture reaches 60 percent--'wet'; (2) reirrigating at the 80 percent depletion

vel--'medium'; and (3) reirrigating at the 100 per-
nt depletion level--'dry'. Canning tomatoes lead
e crops in amount of net returns under all three
igation practices, with sugar beets and alfalfa
y following in that order. A series of linear
ogramming analyses within the framework of 22
nstraints evaluated the potential effects of water
antities, water prices, and tomato prices on total
m net returns. A linear program analysis deter-
ned the impact on crop choices and land alloca-
ns for these two analysis units as water costs rise
m zero price to over $20.00 per acre-foot. These
alyses also indicate that farmers on the better
ils can profit by expanding water use faster as
ices drop, as compared with operators on the
edium soil.

Available from the National Technical Information Service, Springfield, VA 22161 as PB-289 222, Price codes: A05 in paper copy, A01 in microfiche. Alabama Water Resources Research Institute Bulletin 34, Auburn University, September 1978. 111 p, 23 tab, 6 fig. OWRT A-050-ALA(1) and B-071-ALA(1).

Descriptors: *Water systems, *Political aspects, Economics, *Management, *Water supply, *Alabama, Water policy, *State water agencies(Alabama).

Part 1 of this report is a study of two public water systems in Calhoun and Cleburne Counties, Alabama. The focus is on major political and economic dimensions that play a key role in the management of water systems in Alabama. The study reveals that the problem of water management is less one of overall supply than the lack of necessary political-economic organizations in getting water from where it is to where it is needed. Part 2, Some Political and Economic Aspects of Water Agencies in Alabama, is an outgrowth of Part 1. While concentrating on local public water systems which provide direct water services, the study also considers how state agencies established to coordinate, regulate and influence water use can facilitate or inhibit the performance of local public water supply systems. MONTANA'S WATER RESOURCES: A RESEARCH TRUST.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-289 227, Price codes: A03 in paper copy, A01 in microfiche. Montana University Joint Water Resources Research Center, Montana State University, Bozeman, Progress Report, March 1978. 34 p. OWRT A-999-MONT(2). 14-34-0001-7055.

Descriptors: *Progress report, *Montana, Research and development, Legal aspects, *Water Resources Institutes.

The Montana University Joint Water Resources Research Center was established by action of the Board of Regents of the Montana University System on December 8, 1964, under the terms of the Water Resources Research Act of 1964 (Public Law 88-379). The 1975-77 programs of the Center provided funding/administration for twenty allotment, three matching grant, two Title II, and three regional cooperative projects. The projects, which deal with such diverse topics as water quality; economics, social, and institutional studies; mining impacts; saline seep; water resources; land use; wastewater treatment; irrigation effects; and soils-water relationships, are described briefly. Research results have contributed to the control of saline seep, maintaining and improving water quality, analysis and discussion of economic and social issues related to coal-water-energy development in the Yellowstone River Basin, and conservation of precipitation (snow). In addition, the Center has worked closely with state and federal agencies, the Pacific Northwest and Missouri River Basin Commissions, and other institutes in the region; sponsored annual research review conferences; and provided financial support for both undergraduate and graduate students at the three participating University System units. A list of 58 available project completion reports is included. (Hoffman-Montana)

J. P. White.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-289 488, Price codes: A05 in paper copy, A01 in microfiche. Technical Report No. 81. August 1978. 74 p, 192 ref, 1 append. OWRT B-058-IND(1).

Descriptors: *Legal aspects, *Water law, *Water policy, *City planning, *Legislation, Administration, Common law, Water resources development, Riparian rights, Water resources planning, Water management, Urban regional development, Management, Water allocation, Institutions, *Indiana, Statutes, Urban water resources.

Indiana public policy concerning the development and regulation of water resources is surveyed. Existing case law on water use is scant, and adjudicated controversies deal with disputes between individual parties rather than the formation of broad resource use policies. The judiciary does not have the opportunity to do the planning and management necessary to assure adequate water supplies and water quality control for the state of Indiana. Since the legislative branch bears the primary responsibility for statewide, long range planning, Indiana statuatory law concerning water resource management is closely scrutinized in terms of both breadth and efficacy. The relationships between federal, state, and local government agencies in providing for adequate water resource management are also examined. Common law theories on water resource management are then reviewed in reference to the rights of riparian land owners as opposed to the rights of drainage basin occupants. Traditional common law theories are then applied to considerations relevant to the choice between surface water and ground water as a primary source of supply. Finally, the Highland Reservoir proposal and other specific municipal planning activity is evaluated in reference to data gathered in a 1972 survey of water resources in Indiana.

KARSTIC INSTITUTIONAL CONFLICTS AND OPPORTUNITIES,
Appalachian Regional Commission, Washington, DC. Energy, Environment and Natural Resources Div.
H. B. Montgomery.
In: Hydrologic Problems in Karst Regions; Proceedings of Symposium held at Western Kentucky University, Bowling Green, Kentucky, April 26-29, 1976. Department of Geography and Geology, Western Kentucky University, Bowling Green, Kentucky, p 19-31, 1977. 8 fig, 2 tab, 8 ref.

Descriptors: *Karst, *Planning, *Regional development, *Institutions, Subsidence, Appalachian mountain region, Limestones, Research and development, Land use, Research priorities, Governments, Administrative agencies.

The science and engineering of geology can address the problems arising from a growing population's consuming patterns. The consumption can result figuratively in a diminishing world and literally in resource dispersion, which, in effect, is the dilution of high quality natural resources and prime terrain, thereby diminishing their economic availability. The management of growth, known as development, is particularly effective when priorities for investment actions are conceived from multi-program and regional perspectives. When proceeding with reference to the resultant planned overview, a reduction can be achieved in the incidence of adverse conflicts arising from interactions between populations and their environments. If geological wisdom is to provide the maximum help to reducing those conflicts, then geo-specialists must extend themselves beyond their specialty to participate in the decision-making processes socity has designed for institutions to discipline themselves, including the related public participation procedures. Geographic, economic, ecological, environmental, and social impacts from karstic events are part of a broader perception concerning the consequences of undermining the earth's surface. Coal mining, mine roof collapse and surface ground subsidence are comparable to the collapsing of limestone solution cavities. Similarly, many coal mining area communities face post-mining collapse hazards to health, safety, property, general well-being, and quality of life. As national energy needs are satisfied, there will be further threats to community security from mine subsidence events. Experience in addressing current and future community problems caused by coal mine subsidence can assist the development of approaches to resolving unacceptable conditions in karstic terrains. W79-01935

EARLY CONFLICTS OVER EFFLUENT IRRIGATION IN MISSOURI'S OZARKS,
Missouri Univ., Columbia. School of Forestry, Fisheries and Wildlife.
C. D. Settergren.
In: Hydrologic Problems in Karst Regions; Proceedings of Symposium held at Western Kentucky University, Bowling Green, Kentucky, April 26-29, 1976. Department of Geography and Geology, Western Kentucky University, Bowling Green, Kentucky, p 405-410, 1977. 1 fig, 2 ref.

Descriptors: *Waste water disposal, *Water pollution, *Irrigation, *Missouri, Karst, Effluents, Water pollution sources, Groundwater, Jurisdiction, Federal jurisdiction, State jurisdiction, *Missouri Ozarks, Agency conflicts.

Irrigation land disposal of sewage effluent in the Karst Ozarks has been challenged vigorously. There has been a growing concern that the quality of a number of Missouri's spring-fed Ozark streams has become jeopardized by the discharge of wastewater from various sources. In 1973, in an effort to protect selected endangered waterways, Missouri's Clean Water Commission banned all direct discharge. Effluent irrigation was virtually the only state-sanctioned disposal alternative open. Unfortunately for a number of small municipalities and others seeking to comply with the new regulations, the EPA, which must approve all requests for federal planning and construction grants, declared that effluent irrigation is contra-indicated for the Ozarks. The EPA and others contended that the disposal of treated sewage on the karst landscape would endanger the vulnerable groundwater supplies. Others felt that, with the careful selection of an irrigation site and proper system design, effluent renovation could be achieved safely prior to percolation to groundwater. Although early in 1975 the Clean Water Commission provided a way around the dilemma by redefining 'no discharge' to allow for the limited release of secondary treated effluent, there continues to be an information moratorium on effluent irrigation systems in Missouri's Karst Ozarks. (See also W79-01932) (Humphreys-ISWS)
W79-01971

6F. Nonstructural Alternatives

COST REPORT ON NON-STRUCTURAL FLOOD DAMAGE REDUCTION MEASURES FOR RESIDENTIAL BUILDINGS WITHIN THE BALTIMORE DISTRICT,
Army Engineer District, Baltimore, MD.
Available from the National Technical Information Service, Springfield, VA 22161 as ADA-045 013, Price codes: A07 in paper copy, A01 in microfiche. Army Engineer Institute for Water Resources, Fort Belvoir, VA, July 1977, p. 135, 4 append.

Descriptors: *Flood protection, *Floodproofing, *Building codes, *Non-structural alternatives, Construction costs, Relocation, Urban renewal, Planning, Flood damage, Cost estimates, *Baltimore,(MD), *Flood damage reduction, Methodology, Residential buildings.

This report provides cost estimates, structural analysis, and real estate policy guidelines for reducing flood damage via non-structural methods. The 5 non-structural measures include: acquisition and demolition of the existing flood-prone structure; relocation of the flood-prone structure outside the flood plain; relocation of household mechanical and electrical equipment to an area that is not subject to flooding; raising the first floor of a flood-prone structure; and floodproofing the basement against infiltration. Commercial and industrial establishments are outside the intended scope of this report. Cost estimates are for four locations in Baltimore. The report provides an introduction to the purpose and design of the cost analysis of each method, the various assumptions and considerations relating to the evaluation of each measure, the results of the cost analysis for each method and combination of methods, and a general discussion on the applicability of each non-structural measure given a water surface location. This report can be utilized by planners, homeowners, and local officials trying to reduce or eliminate flood damages to residential structures by using nonstructural approaches. (Coan-NC)
W79-01832

PHYSICAL AND ECONOMIC FEASIBILITY OF NONSTRUCTURAL FLOOD PLAIN MANAGEMENT MEASURES,
Hydrologic Engineering Center, Davis, CA.
W. K. Johnson.
Prepared for Army Corps of Engineers, Ft. Belvoir, VA, Institute for Water Resources. March 1978, 95 p, 3 append.

Descriptors: *Flood plain zoning, *Land use, *Planning, *Flood insurance, *Nonstructural alternative, *Economic feasibility, Zoning, Flood forecast, Flood warning, Flood control, Costs, Project feasibility, Flood protection, *Flood plain management, Sensitivity analysis.

The purpose of this study is to examine the physical and economic feasibility of a number of nonstructural flood control measures and develop criteria for their use. Eleven such measures are selected; this report evaluates their overall physical and economic feasibility. The measures studied are: temporary and permanent closures for openings in existing structures; raising existing structures; construction of new structures on fill or columns; small walls or levees around structures; relocating or protecting damageable property; relocating existing structures and/or contents out of a flood hazard area; flood forecast, warning and evacuation; use of water resistant materials in construction; regulation of development of flood plain land through zoning ordinances, subdivision regulations and building codes; public acquisition of title or easement to flood plain land; and flood insurance. Cost estimtes, advantages, disadvantages and references are provided for each measure. A sensitivity analysis of flood damage in relation to various hydrologic, hydraulic, and economic parmeters was conducted. These parameters include elvation-frequency relationship, frequency 'skew,' depth-damage relationship, value of structure contents as a percentage of the value of a structure, type of structure, and location in the floodplain. The effectiveness of selected nonstructural measures was then evaluated by computing the damage reduced for several levels of protection. It was found that nonstructural measures have an important role alongside structural measures in reducing flood losses. Every measure investigated was found to be physically and economically feasible in some flood hazard situation, and particular applications and limitations were identified. (Coan-NC)

6G. Ecologic Impact Of Water Development

ECOLOGICAL RECOVERY OF REALIGNED STREAM CHANNELS,
Federal Highway Administration, Portland, OR.
T. J. McClellan.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-266 657, Price codes: A05 in paper copy, A01 in microfiche. Report FHWA-OR-74-1, 1974. 98 p, 9 ref, 4 append.

Descriptors: *Fish populations, *Wildlife habitats, Construction, *Oregon, *Channel morphology, Channel improvement, Ecology, Fish migration, Spawning, Bank protection, Embankments, River beds, On-site investigations.

A field investigation of 18 highway-related, stream channel changes in Oregon was made in 1973 to evaluate the effectiveness of natural processes in restoring conditions favorable to use as habitat of the altered streams by fish and of streamside areas by small game. Known conditions prior to channelization, the channel design, construction methods followed, and any measures taken to mitigate harm to the ecology of the stream were used as a basis for comparing the local effects of the various types of alteration. Design features found to be significantly damaging to the stream fishery or to wildlife were discussed in the report. Some measures to prevent or alleviate similar damage by future highway construction were suggested. An appendix presented the findings of a preliminary review of pertinent literature and the detailed case study made in 1972 of a representative stream alteration. (Adams-ISWS)

Available from the National Technical Information Service, Springfield, VA 22161 as ANL-ES-40 Vol. 11, Price codes: A05 in paper copy, A01 in microfiche. Argonne National Laboratory, Illinois, Publication No. ANL/ES-40, Vol. 11, September 1977. 90 p, 1 fig, 6 tab, 72 ref. W-31-109-Eng-38.

Descriptors: *Lake Michigan basin, *Endangered species, *Threatened species, *Natural areas, *Plant populations, *Animal populations, *Natural resources, Great Lakes, Lakes, Watersheds(Basins), Biological communities, Ecology, Ecosystems, Habitats, Michigan, Illinois, Wisconsin, Indiana, Preservation, Baseline studies, Beaches, Forests, Dunes, Prairies, Wetlands, Birds, Mammals, Reptiles, Amphibians, Fish.

This report: (1) enumerates and describes 139 designated natural areas in the Lake Michigan drainage basin--46 in Wisconsin, 45 in Michigan, 37 in Indiana, and 11 in Illinois; (2) lists endangered and threatened plants and animals in the basin; and (3) identifies critical natural communities in the basin. 'Natural area' is a tract of land which has retained its natural character or has regained it after disturbance; it may include significant geological, archaeological, or scenic features, support a highly diverse or unique fauna or flora, or illustrate ecological principles well. Nature preserves are scientifically, educationally, or culturally valuable, and provide aesthetic, practical, and long-range socioeconomic benefits. Federal and state legislation on endangered and threatened species is reviewed, and annotated lists for the basin are provided. Endangered species include five mammals, six birds, four reptiles, nine fishes, and 10 plants, and threatened species include five mammals (plus 23 additional species), 15 birds, eight reptiles, 10 fishes, four amphibians, and 25 plants. Habitat degradation and destruction is though the most important factor threatening particular species; elimination of certain plant communities would lead to loss of many plant and animal species in the basin, or even extinction. Such communities are located in or on: (1) beaches and sand dunes, (2) prairies, (3) southern mesic forests, (4) wetlands, and (5) natural flowing springs. (Lynch-Wisconsin)

A PRELIMINARY ECOLOGICAL SURVEY OF DARDANELLE RESERVOIR PRIOR TO NUCLEAR FACILITY EFFLUENT DISCHARGE,
Arkansas Water Resources Research Center, Fayetteville.
C. B. Sinclair, and R. L. Watson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-289 236, Price codes: A04 in paper copy, A01 in microfiche. Technical completion report (No. 60), 1978. 45 p, 4 fig, 1 tab, 36 ref. Appendices available upon request from Center. OWRT A-012-ARK(1).

Descriptors: *Ecological surveys, Reservoirs, *Arkansas, *Dardanelle Reservoir(Ark), Nuclear power plants, Plankton, Benthos, Sampling, Zooplankton, Diatoms, Phytoplankton, Crustaceans.

A preliminary ecological survey of Dardanelle Reservoir during the construction phase of Ark. Power and Light Company's nuclear generating facility was conducted from Jan. 1970 - June 1974. The reservoir is characterized by relatively shallow depths and a high flow-thru rate. The reservoir carried a great deal of suspended materials and exhibited high turbidities throughout most of the year. Typical thermal stratification and oxygen depletion were only rarely observed. Many of the physico-chemical parameters exhibited relatively high values in comparison to other Arkansas lakes and reservoirs, but due to absence of prolonged periods of stratification, they did not undergo the extreme fluctuations sometimes observed in other reservoirs. Plankton and benthic samples were collected at least nine times per year from 10 stations. There were a great variety of forms in the phytoplankton with the diatoms making up a considerable portion. The level of turbidity appeared to dampen somewhat the extreme fluctuations sometimes found in 'bloom' periods. In the zooplankton the rotifers Brachionus, Keratella, and Polyarthra predominated followed by the microcrustaceans Cyclops and Bosmina. Both the plankton and benthic fauna showed great seasonal variation. The benthic fauna consistred primarily of Chironomidae, Oligochaeta, and Hexagenia with the Chronomidae predominating in the shallower depths and the Oligochaeta exhibiting increased abundance and importance in the deeper stations.

PRESERVING THE HERITAGE OF GASPARILLA ISLAND, AN APPROACH TO CONSERVATION OF THE ECONOMIC, CULTURAL, HISTORICAL, AND NATURAL RESOURCES OF THE ISLAND,
Conservation Foundation, Washington, DC.
J. Clark.
1978. 41 p, 12 fig, 6 tab, 10 ref.

Descriptors: *Survey, *Natural resources, *Islands, *Florida, Wetlands, Beach, Dunes, Mangrove swamps, Development, Conservation, *Gasparilla Island(Fla).

This report is a reconnaissance survey of Gasparilla Island resources with some general considerations for their conservation. The major subsystems, or ecological zones, are: beaches and dunes, hammocks and savannahs, wetlands and interior waters, and mangroves and estuarine waters. Each of these is discussed according to their different environmental functions, values, and suitabilities for development. (Steiner-Mass)

IMPACT OF OFFSHORE OIL AND GAS DEVELOPMENT ON THE COASTAL ZONE: RE-

FORMING THE IMPACT ASSESSMENT PROCESS,
Rutgers - The State Univ., New Brunswick, NJ. Dept. of Environmental Resources.
J. K. Mitchell.
Coastal Zone Management Journal, Vol 4, No 3, p 299-327, 1978. 1 tab, 72 ref.

Descriptors: *Oil pollution, *Water pollution effects, *Environmental effects, Coasts, Gas, Resources development, Management, *Outer Continental Shelf, Petroleum development, Environmental impact statements, Onshore impacts.

In an otherwise complex regulatory system, the federal Environmental Impact Statement process affords loca decision makers and coastal zone residents a rare opportunity to analyze the comprehensive range of land-use and environmenta issues that may arise from Offshore Continental Shelf (OCS) hydrocarbon development, while there is still time to formulate effective management strategies. As exemplified by the lease sale 40 statement, present onshore impact assessment procedures are sufficiently flawed to seriously compromise this goal. Critical deficiencies include failure to emphasize onshore impacts; insensitivity to spatial variations of impact; neglect of available data; rigid, unsupported assumptions; and preoccupation with short-term effects to the exclusion of more significant and dependent long-term consequences. Suggested reforms include preparation of separate exploration and development impact statements; establishment of special Council on Environmental Quality review procedures; modification of the judicial review process; and provision of additional support to local onshore OCS impact areas. ENVIRONMENTAL ANALYSES IN THE KOOTENAI RIVER REGION, MONTANA,
Army Terrestrial Sciences Center, Hanover, NH.
H. L. McKim, L. W. Gatto, C. J. Merry, B. E. Brockett, and M. A. Bilello.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A033 500, Price codes: A04 in paper copy, A01 in microfiche. CRREL Special Report 76-13, November 1976, 53 p, 21 fig, 5 tab, 11 ref, 3 append.

Descriptors: *Remote sensing, *Satellite(Artificial), *Montana, *Data transmission, *Lake morphology, Ice cover, Snowpacks, Water quality, Eutrophication, Telemetry, Stratification, Circulation, *Kootenai River(Mont).

This investigation (1) compiled and analyzed climatic data for the past 10 years from all available weather observing stations in the East Kootenai River Basin, (2) analyzed changes in ice and snow cover, and turbidity and plankton blooms on Lake Koocanusa, (3) assessed the present limnology of Lake Koocanusa and the potential for water quality problems, especially eutrophication, and (4) demonstrated the reliability of the LANDSAT Data Collection Platform (DCP)-Martek Water Quality Monitor system for acquisition of data from a remote site. Results indicated that the Kootenay region is about twice as cold as the Libby region in winter, and that reservoir ice first forms along the shore in the northern region in lake November and in the southern part in mid-December, with total freeze-over usually occurring 2 to 4 weeks later. Ice break-up in the northern sections usually occurs 1-3 weeks later than in southern areas; average annual snowfall is 42 to 144 inches, with ice thickness and snowfall varying with relief. Variations in areal distribution of snow within the basin and ice cover on the reservoir were observable for periods from January to October 1973. Reservoir turbidity was observed to increase south of Ellsworth and Stenerson Mountains. Low algal productivity observed was due to the algae being circulated most of the time below the depth of 1% light to high turbidity. The DCP-Martek system operated well, and reliable data were received while the system was located in the pool above Libby Dam and downstream below the dam. Brief interruptions in data transmissions occurred when the Martek sensor showed a few minor inconsistencies, but the system demonstrated the feasibility of this technique for data acquisition from remote sites. APPLICATION OF REMOTE SENSING IN ESTIMATING EVAPOTRANSPIRATION IN THE PLATTE RIVER BASIN,
Nebraska Univ., Lincoln.
B. L. Blad, and N. J. Rosenberg.
Available from the National Technical Information Service, Springfield, VA 22161 as N76-30634, Price codes: A03 in paper copy, A01 in microfiche. NASA-CR-148775, April 30, 1976. 33 p, 15 fig, 1 tab, 19 ref, 1 append. NASA-NGL28-004-020.

Descriptors: *Evapotranspiration, *Remote sensing, *Model studies, Temperature, Crop production, Hydrology, Irrigation, Mass transfer, Alfalfa, Thermometers, *Nebraska, *Platte River Basin(Neb), *Thermal scanners.

A 'resistance model' and a mass transport model for estimating evapotranspiration were tested on large fields of naturally sub-irrigated alfalfa. Both models make use of crop canopy temperature data, obtained with an IR thermometer and with leaf thermocouples. A Bowen ratio-energy balance model, adjusted to account for underestimation of evapotranspiration during periods of strong sensible heat advection, was used as the standard against which the resistance and mass transport

dels were compared. Daily estimates by the stance model were within 10% of estimates de by the Bowen model. Daily estimates by the ss transport model did not agree quite as well. formance was good on clear and cloudy days also during periods of non-advection and ng advection of sensible heat. The performance he mass transport and resistance models was satisfactory for estimation of fluxes of latent t for short-term (15 min) periods. Both models ded to overestimate at low fluxes. CHNIQUES FOR SAMPLING SALT MARSH NTHOS AND BURROWS,
rgia Univ., Athens. Dept. of Geology.
V. Frey, P. B. Basan, and R. M. Scott.
American Midland Naturalist, Vol. 89, No. 1, 28-234, January, 1973. 2 fig, 9 tab.

criptors: *Sampling, *Salt marshes, *Benthos, rshes, *Burrows, *Georgia.

tain salt marsh benthos are difficult to collect ntitatively, especially the mobile epibenthos endobenthos that dwell within or below dense ss-root masses. Techniques adapted in conjunc- with a study of Georgia marshes helped to lve many of these difficulties. Useful methods uded: (1) High-walled quadrat frames to entrap collect mobile animals. Marsh grass inside the drat is first cropped nearly to root level and oved to secure quantitative grass samples and lear the area of obstructions in collecting the s and other epibenthos. Intrusion causes the eat of crabs to their burrows but this problem is dled by leaving the area at regular intervals, wing the remaining animals to return to the ace, then returning to collect them. (2) Can es were used to obtain volumetric substrate ples, from which endobenthos were rcovered means of a combined sieving-staining-flotation cedure. (3) Polyester plastic casts of burrows burrow networks were used to evaluate depth, sity, volume, and conspecific morphologies of rows. (Maroncelli-Mass)

E OF LANDSAT DATA TO RELATE WATER PTH TO OBSERVED AREA OF INUNDA-N IN COASTAL MARSHES,
isiana State Univ., Baton Rouge. School of estry and Wildlife Management.
. Graff.
. Thesis, Louisiana State University and Agri-ural and Mechanical College. December, 1976. , 13 fig, 5 tab, 23 ref.

criptors: *Coastal marshes, *Remote sensing, apping, Wetlands, Census, Aerial photography, veys, Terrain analysis, Marsh management, isiana, Infrared radiation, Distribution patterns, rshes, LANDSAT, Water surface area, *Water th, *Water level fluctuations.

of LANDSAT data to measure changes in er surface areas in a 30.64 sq. kilometer section ouisina's coastal marsh was evaluated. Optical mputer estimates of water surface areas from NDSAT data were compared to optical esti-es derived from low altitude infrared aerial tography. Water depths were taken coincident magery and photography and related to the ace areas obtained by concidendent to imagery photography and relted to the surface areas ined by the three methods. LANSAT data e determined not to be well suited to measure-t of water surfaces areas in this application use of lack of flexibility in scheduling, insuffi-t resolution; need for broader spectral recep-tivity; and too small a scale to properly study such a small area. In coastal marshes numerous small tidal pools and stands are smaller than 100 m; significant hydrologic changes occur in short peri-ods of time; and the surface character is predomi-nantly a heterogeneous mixture of water vegeta-tion, and mud which varies in percent composition from one place to another, and consequently has no distinctive tones, patterns, or textures on the imagery. (Steiner-Mass)

APPLICATION OF LANDSAT IMAGE WET-LAND STUDY AND LAND CLASSIFICATION IN WEST TENNESSEE,
Tennessee University Space Inst. Tullahoma. Remote Sensing Div.
F. Shahrokhi, and N. L. Jones.
1977. 61 p, 17 fig, 6 tab, 18 ref.

Descriptors: *Remote sensing, *Tennessee, *Land use, *Wetlands, Aerial photography, *Classifica-tion, Mapping, Earth-water interfaces, Watershed management, LANDSAT data, West Tennessee.

Information is given on basic equipment and meth-ods for analysis of photographic data obtained from LANDSAT as well as high and low altitude aircraft. In addition, instructions are provided for utilizing such equipment and methods to explore a specific application. This application involves a study to determine land use classifications for a selected watershed in West Tennessee with special emphasis on determining wetland boundaries, and there by provide resource information to appropri-ate agencies for management and preservation pro-grams. (Steiner-Mass)
W79-01638

THE VERIFICATION OF LANDSAT DATA IN THE GEOGRAPHICAL ANALYSIS OF WET-LANDS IN WEST TENNESSEE,
Tennessee Univ., Knoxville.
J. Rehder, and D. Quattrochi.
National Aeronautics and Space Administration, Contractor Report 3012. June, 1978. 134 p, 9 fig, 8 tab, 31 maps, 27 ref, 2 append.

Descriptors: *Wetlands, *Remote sensing, *Ten-nessee, *Technical feasibility, *Classification, Map-ping, *Land use, Earth-water interfaces, Swamps, Seasonal, *LANDSAT data, West Tennessee.

LANDSAT imagery is a reliable data source for detecting, identifying, measuring, and mapping wetlands in West Tennessee. the degree of carto-graphic and measurement accuracy, however, de-pends upon the interpretative and planimetric qua-lities of the data, such as internal geometric distor-tion, edge sharpness, and scale of the imagery; and the skill of the interpreter. Although the signature exhibited by wetlands is the primary key to their delimitation, the color and tone of swamplands is affected by seasonal dynamics. The ease of difficul-ty of wetlands detection fluctuates temporarily; the amount of water and foliation present are cognitive views for seasonal swampland mapping. 1:25, 000 sale color composite imagery is the most useful type of imagery for accurately mapping and meas-uring wetlands from LANDSAT data. (Steiner-Mass)

REMOTE SENSING OF WETLANDS,
Environmental Research Inst. of Michigan, Ann Arbor. Infrared and Optics Div.
N. E. G. Roller.
Available from the National Technical Information Service, Springfield, VA 22161 as N77-26588, Price codes: A08 in paper copy, A01 in microfiche. Report 193400-14-T to National Aeronautics and Space Administration, Washington, D.C., Office of University Affairs, March, 1977. 155 p, 29 fig, 14 tab, 72 ref.

Descriptors: *Wetlands, *Remote sensing, *Cost comparisons, *Census, Mapping, Aerial photogra-phy, Surveys, Terrain analysis, Marsh manage-ment, Wetland inventories.

Aerial photography is the form of remote sensing from which the greatest amounts of wetlands infor-mation can be derived. For extensive, general-purpose wetland inventories, however, the use of LANDSAT data may be more cost-effective. Air-borne multispectral scanners and radar are, in the main, too expensive to use unless absolutely re-quired. Multistage sampling employing space and high altitude remote sensing data in the initial stages appears to be an efficient survey strategy for gathering non-point specific wetlands inventory data over large areas. The operational mode of remote sensing in supplying inventory data for application to several typical wetland management problems is illustrated by summary descriptions of past ERIM projects. ASSEMBLY FOR MOUNTING HYDRAULIC SOIL CORE SAMPLER ON TRACTOR FRONT,
Agricultural Research Service, Stoneville, MS.
L. H. Ginn, L. G. Heatherly, and W. J. Russell.
Soil Science Society of America Journal, Vol 42, No 3, p 512-514, May-June, 1978. 4 fig, 6 ref.

Descriptors: Cores, *Sampling, *Soil types, Hy-draulic equipment, *Instrumentation, *Core sam-plers.

A front-mounted tractor assembly for support of a hydraulic soil core sampler was constructed. The design satisfied requirements for rapid soil or root core sampling. An essential part of the assembly is a tool bar which allows lateral movement of the mounted core sampler. The assembly with mount-ed sampler is capable of extracting 1.9 to 10.2-cm diameter cores to depths as great as 125 cm throughout a 102-cm lateral path. (Skogerboe-Colorado State)

ANALYTICAL STUDY OF THE OGALLALA AQUIFER IN TERRY COUNTY, TEXAS, PROJECTIONS OF SATURATED THICKNESS VOLUME OF WATER IN STORAGE, PUMPAGE RATES, PUMPING LIFTS, AND WELL YIELDS,
Texas Dept. of Water Resources, Austin.
A. E. Bell, and S. Morrison.
Report 222, September 1978. 68 p, 18 tab, 72 re
24 map.

Descriptors: *Groundwater resources, *Texa
Aquifers, *Data collections, Groundwater, Map
Water resources, Aquifer characteristics, Groun
water availability, Groundwater mining, Ove
draft, Groundwater recharge, Pumping, Proje
tions, Saturated flow, Water wells, *Terr
County(Texas), *Ogallala aquifer(Texas), Pumpag
rates, Pumping lifts, Well yields.

This is one of numerous planned county studi
covering the declining groundwater resource
the Ogallala aquifer in the high Plains of Texa
The report contained maps, charts, and tabulatio
which reflect estimates of the volume of water
storage in the Ogallala aquifer in Terry Coun
and the projected depletion of this water supply b
decade periods through the year 2020. The repo
also contained estimates of pumpage, pumping lift
and other data related to current and future wat
use in the county. However, the report did n
attempt to project that portion of the volume
water in underground storage which may be ult
mateley recoverable. the Ogallala aquifer in Ter
County contained approximately 3.2 million acr
feet ofwater in 1974. Historical pumpage has e
ceeded 130,000 acre-feet annually, which is mo
thatn twuicef the rate of natural recharge to t
aquifer in the county. This overdraft is expected
continue, ultimately resulting in reduced w
yields, reduced acreage irrigated, and reduced a
ricultural production. (Humphreys- ISWS)

or County lies within the drainage basins of razos and Red Rivers in North-central Texas, ring and area of about 857 square miles. ia rocks of the Wichita and Clear Fork ps are found at the surface within the county t where they are overlain by erratic deposits eistocene and Recent alluvium of thee Quater- System. Small to moderate quatities of fresh ghtly saline groundwater are produced from t alluvial deposits. Water quality is generally in this aquifer. However there are some local ems that are probably caused by poor quality flowing in adjacent streams. The Seymor ation of Pleistocene age is the major source oundwater. In parts of a 73 square-mile area ding from the city of Seymour west to the County line and lying between the Brazos Wichita Rivers, wells can sustain yields up to allons per minute. Water quality is generally in the Seymour Formation. More tha 90% og vells sampled produce water with less than milligrams per liter dissolved solids. Chloride nt in the Permian and Quaternary rocks d from 5 to 3,240 milligrams per liter, ad 65 es contained more than the 250 milligrms per (humphreys-ISWS)

LYTICAL STUDY OF THE OGALLALA IFER IN COCHRAN COUNTY, TEXAS, JECTIONS OF SATURATED THICKNESS, UME OF WATER IN STORAGE, PUM- E RATES, PUMPING LIFTS, AND WELL DS,
Dept. of Water Resources, Austin.
Bell, and S. Morrison.
rt 217, July 1978. 68 p, 18 tab, 70 ref, 24 map.

riptors: *Groundwater resources, *Texas, ifers, *Data collections, Groundwater, Maps, resources, Aquifer characteristics, Ground- recharge, Water supply, Groundwater avail- , Groundwater mining, Overdraft, Pumping, Projections, Saturated flow, Water wells, *Coch- ran County(Texas), *Ogallala aquifer(Texas), Pum- page rates, Pumping lifts, Well yields.

This is one of numerous planned county studies covering the declining grounddwater resource of the Ogallala aquifer in the High Plains of Texas. The report contained maps, charts, and tabulations which reflect estimates of the volume of water in storage in the Ogallala aquifer in Cochran County and of the projected depletion of this water supply by decade periods through the year 2020. The report also contained estimates of pumpage, pumping lifts, and other data related to current and future water use in the county. However, the report did not attempt to project that portion of the volume of water in underground storage which may be ultimately recoverable. The Ogallala aquifer in Cochran County contained approximately 2.9 million acre-feet of water in 1974. Historical pumpage has exceeded 90,000 acre-feet annually, which exceeds considerably the rate of natural recharge to the aquifer in the county. This overdraft is expected to continue, ultimately resulting in reduced well yields, reduced acreage irrigated, and reduced agricultural production. (Humphreys-ISWS)
W79-01930

ANALYTICAL STUDY OF THE OGALLALA AQUIFER IN LUBBOCK COUNTY, TEXAS, PROJECTIONS OF SATURATED THICKNESS, VOLUME OF WATER IN STORAGE, PUMPAGE RATES, PUMPING LIFTS, AND WELL YIELDS,
Texas Dept. of Water Resources Austin.
A. E. Bell, and S. Morrison.
Report 216, June 1978. 68 p, 18 tab, 70 ref, 24 map.

Descriptors: *Groundwater resources, *Texas, *Aquifers, *Data collections, Groundwater, Maps, Water resources, Aquifer characteristic, Groundwater recharge, Water supply, Groundwater availability, Groundwater mining, Overdraft, Pumping, Projections, Saturated flow, Water wells, *Lubbock County(Texas), *Ogallala aquifer(Texas), Pumping rates, Pumping lifts, Well yields.

This is one of numerous planned county studies covering the declining grounddwater resource of the ogallala aqufer in the High Plains of Texas. The report contained maps, charts, and tabulations which reflect estimates of the volume of water in storage in the Ogallala aquifer in Lubbock County and of the projected depletion of this water supply by decade periods through the year 2020. The report also contained estimates of pumpage, pumping lifts, and other data related to current and future water use in the county. However, the report did not attempt to project that portion ofthe volume of water in underground storage which may be ultimately recoverable. The Ogallala aquifer in Lubbock County contained approximately 5.5 million acre-feet of water in 1974. Historical pumpage has exceeded 150,000 acre-feet annually, which is many times the rate of natural recharge to the aquifer in the county. This overdraft is expected to continue, ultimately resulting in reduced well yields, reduced acreage irrigated, and reduced agricultural production. (Humphreys-ISWS)

A MANUAL FOR HYDROLOGIC TIME SERIES DESEASONALIZATION AND SERIAL DEPENDENCE REDUCTION,
Iowa Univ., Iowa City. Inst. of Hydraulic Research.
T. E. Croley, II, and K. N. Rajo Rao.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-272 632, Price codes: A08 in paper copy, A01 in microfiche. IIHR Report No 199, June 1977. 151 p, 23 ref, 8 append. OWRT A-054-IA(6). 14-34-0001-6016.

Descriptors: *Stochastic processes, Hydrology, *Computer studies, *Statistical models, *Planning, Operations research, Model studies, *Time series analysis, Statistical methods, Deseasonalization, Data processing, Computers, Statistics, Water resources.

Procedures for analysis of stochastic structure of hydrologic time series were described using an approach which is realistic, practical, and compatible with a subsequent data generation. Essentially, the procedure consists of identifying and estimating annual periodicities in means, standard deviations, and autocorrelation coefficients in the time series. Estimated parameters and computed time dependence structure are removed from the original time series, thereby reducing it to a second order stationary and serially independent process. This aids in constructing a general deterministic-stochastic model representing the relevant time series which can be used for generating synthetic sequences of data that are statistically indistinguishable from the historic data. For demonstration, the approach was applied to real-life problems relating to monthly, weekly, and daily values of hydrologic time series and the results are illustrated. (Majtenyi-IPA)

8A. Structures

COLLAPSIBLE AND EXPANSIBLE BARRAGE,
Pirelli Furlanis - Applicazioni Idrauliche Agricole Gomma S.p.A., Milan (Italy). (Assignee).
A. Colamussi, and V. Merli.
U.S. Patent No. 4,103,496, 6 p, 6 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 973, No 1, p 57, August 1, 1978.

Descriptors: *Patents, *Barriers, *Structures, *Dams, Movable dams, Obstruction to flow, Flow control.

A collapsible and expansible barrage or barrier is described which is composed of a metallic flap and flexible sheet of material, both of which are fixed to a base structure at the bottom of a waterway such as a river, arm of the sea, lagoon or the like, which is to dammed up. The invention provides stability to the barrage in expanded condition when it is enduring stresses such as a flood-wave in a river or the undulating motion in a stretch of sea or lagoon. The base or threshold structure is provided with a hollow recess for housing the barrage in its collapsed state. Means are provided for admitting or extracting water into the closed space defined by the threshold structure, the metallic flap and the flexible sheet. An airtank admits pressurized air into the barrage. (Sinha-OEIS)

THE USE OF INCLINED BOREHOLES FOR WELL DEVELOPMENT,
Institute of Geological Sciences, London (England).
J. B. W. Day, K. Rowe, M. Price, and T. K. Tate.
Journal of the Institution of Water Engineers and Scientists, Vol 32, No 4, p 329-340, July 1978. 8 fig, 2 tab, 4 ref.

Descriptors: *Water wells, *Model studies, *Water supply development, *Laboratory tests, *On-site tests, Boreholes, Water yield improvement, Water yield, Groundwater, Aquifers, Well data, Hydraulic models, Water quality, Drawdown, On-site investigations, Foreign countries, Foreign research, *England, Water well development.

The systematic development of a well by intersecting inclined bores ('rakers') drilled from the surface has been attempted. Initial sand tank model studies indicated that, under unconfined conditions with four tubes disposed radially and inclined at 60 deg to the horizontal and under differing levels of the water table, increases in the yield of a central well of about one-third could be obtained for a fixed drawdown. Subsequent field tests on a Chalk well at Lyng, Norfolk, have shown greater increases in yield: three boreholes which were inclined at 45 deg and drilled to intersect a central well about 31 m below the average level of the water table more than doubled its yield. In both cases, results tended to confirm predictions based on theoretical relationships between well diameter and yield for both homogeneous and fissure flow aquifers. (Humphreys-ISWS)

EFFECTS OF CONSTRUCTION OF LIBERTY STATE PARK ON HYDRAULIC CHARACTERISTICS OF NEW YORK HARBOR; HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, MS. Hydraulics Lab.
R. F. Athow, Jr., and R. A. Boland, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A030 471, Price codes: A08 in paper copy, A01 in microfiche. Miscellaneous Paper H-76-18, Sept 1976. 156 p, 88 fig, 39 tab.

Descriptors: *Harbors, *Model studies, *Hydraulic models, *New Jersey, Currents(Water), Velocity, Tides, Tidal waters, Circulation, Parks, Effects, Salinity, Dye releases, Hydraulics, Estuaries, Rivers, *New York Harbor.

An existing comprehensive physical model that correctly reproduced tides, tidal currents, and density currents throughout the entire New York Harbor was used to determine the effects of constructing a proposed State park complex on the Jersey City waterfront, just west of Ellis and Liberty Islands. The study included tests in the model of seven different park configurations to define their effects on tidal heights, current velocities, surface current patterns, salinities, and flushing characteristics of a proposed Serpentine (a tidal-influenced canal west of the park area). Based on the results of the model tests, the following conclusions were reached: (1) none of the plans tested would have any significant effects on tidal heights or tidal phasing in the study area; (2) the plans tested would not change the velocity regime of the area, except very locally and with magnitudes not thought to be hazardous to safe navigation or to increase the existing erosion potential of the area; (3) the existing salinity regime of the area would not significantly change as a result of the plans tested; (4) in plans 1, 4, and 7, which include the Serpentine, mass flow will occur through the Serpentine, and a small gyre rotating counterclockwise will develop at the approximate location of salinity and dye sta 2, indicating no through flow at this station, only rotational motion; and (5) dye released at the westernmost end of Morris Canal Basin will move through the Serpentine and be flushed out the south end of the Serpentine, resulting in increased dye concentrations in the wildlife area and a lesser increase at the south entrance to the Serpentine. FLOATING BREAKWATERS: AN IDEA WHOSE TIME HAS RETURNED,
Washington Univ., Seattle. Dept. of Mechanical Engineering.
B. H. Adee.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-259 048, Price codes: A02 in paper copy, A01 in microfiche. Report No WSG-TA 75-27, IEEE Ocean, p 707-715, 1975. 20 fig, 6 ref.

Descriptors: *California, *Oregon, *Washington, *Canada, *Breakwaters, *Coastal structures, *Design, *Construction, Waves(Water), Frequency, Comparative costs, Performance, Marinas, Model studies, *Floating breakwaters, *British Columbia(Canada), A-frame breakwaters, Sea grant program.

A review of recent developments in the construction of floating breakwaters was presented. Types of breakwaters considered were the A-frame used at Lund, British Columbia; Alaska modules installed at Tenakee, Sitka, and Whittier, California; those used at Friday Harbor, Holmes Harbor, and Port Orchard, Washington, and Yaquina Bay, Oregon; and many others in the prototype testing stages. Because the performance of floating breakwaters is very sensitive to incident wave frequency, comparisons of performance were made over a range frequencies. Construction techniques and materials were examined, and their field performances were assessed. Some data on the effectiveness of each of the breakwaters and their cost were included for comparison purposes. (See also W76-10460, and W78-00842) (Singh-ISWS)

FLOATING BREAKWATER FIELD ASSESSMENT PROGRAM, FRIDAY HARBOR, WASHINGTON,
Washington Univ., Seattle. Dept. of Mechanical Engineering.
B. H. Adee, E. P. Richey, and D. R. Christensen.
Available from the National Technical Information Service, Springfield, VA 22161 as ADA-032 183, Price codes: A11 in paper copy, A01 in microfiche. Technical Paper No 76-17, Issued by Army Corps of Engineers, Ft Belvoir, Va., Coastal Eng. Res. Ctr., October 1976. 224 p, 75 fig, 4 tab, 18 ref, 1 append. DACW 72-74-C-0012.

Descriptors: *Washington, *Breakwaters, *Model studies, *On-site tests, *Waves(Water), Performance, Coastal structures, Statistical methods, Boundary processes, Analytical techniques, *Floating breakwaters, *Friday Harbor(Wash).

A theoretical model for predicting the dynamic behavior of a floating breakwater was presented along with a report on a field experiment designed to provide basic data for verifying the model. The dynamic behavior characteristics investigated were total transmitted and reflected waves and their components, wave forces on the breakwater, motions of the breakwater, and forces on the mooring lines. The prediction model was developed from two-dimensional, linearized solutions of the hydrodynamical equations formulated in terms of a boundary value problem for the velocity potential. The floating breakwater at Friday Harbor, Washington, was used as the field experimental platform. Statistical summaries of all data were presented along with analyses of selected transmitted waves, transmission coefficients, and acceleration components. The summaries and analyses constitute a performance report of a particular floating breakwater as well as input to the development of the theoretical model. (Singh-ISWS)

AN INTRODUCTION TO EMISSION UNI- FORMITY,
Rain Bird Sprinkler Mfg. Corp., Glenora, CA.
K. Solomon.
Drip/Trickle Irrigation, Vol 2, No 2, p 6-10, January/February 1977. 3 fig.

Descriptors: *Irrigation systems, *Irrigation engineering, *Irrigation design, Hydraulics, Hydraulic design, Irrigation efficiency, Flow rates, Uniform flow, Uniformity coefficient.

The more nearly perfect a system is in terms of emission uniformity, the more it is likely to cost. Various devices, material substitutions and design techniques are available to minimize the problems leading to nonuniformity of emission, but they all cost money and/or time. So the costs of approaching perfection must be weighed carefully against the costs of not achieving it. (Skogerboe-Colorado State)

PREDICTION OF FLOW HYDRAULICS FOR VEGETATED CHANNELS,
Kentucky Univ., Lexington. Dept. of Civil Engineering.
D. T. Y. Kao, and B. J. Barfield.
Transactions of the American Society of Agricultural Engineering, Vol. 21, No. 3 p 489-494, May-June 1978. 8 fig, 1 tab, 15 ref.

Descriptors: *Channel flow, *Grassed waterways, *Vegetation effects, *Roughness(Hydraulic), Model study, Mathematical models, Laboratory tests, Flumes, Grasses, Shallow water, Hydraulic properties, Hydraulic similitude, Flow, Graphical analysis, Vegetation, Hydraulics.

Simulated dense vegetation with random blade arrangements and different blade flexibilities were used to determine the hydraulic properties of flow of small, non-submerging depths. With the water flowing among the randomly patterned vegetation blades, drag resistance becomes the dominant force that retards the flow was established based on the momentum balance in the system. Experimental results were used to determine the coefficient of blade resistance and were plotted in terms of blade width and flow depth reynolds number respectively. Based on these plots and on successful introduction of the three different sets of parameteric curves, a graphical method was developed to permit the determination of flow depth in the vegetated channel. HYDRAULIC FRICTION LOSS IN SMALL DIAMETER PLASTIC PIPELINES,
Utah Univ., Logan. Dept. of Civil and Environmental Engineering.
T. C. Hughes, and R. W. Jeppson.
Water Resources Bulletin, Vol. 14, No 5, p 1159-1166, October 1978. 1 fig, 1 tab, 2 ref.

Descriptors: *Friction, *Plastic pipes, *Mathematical studies, Design, Design criteria, Hazen-Williams equation, Darcy-Weisbach equation, Reynolds number, Water supply, Hydraulics, Pipes, Equations, *Hydraulic friction, Friction loss, Smal plastic pipe.

Although estimation of hydraulic friction loss in pipelines is one of the most frequent routine computations made by water supply engineers, almost no post-construction analysis of the accuracy of these calculations exists in the literature. This paper reported the field measured friction losses in 3 one-mile sections of small diameter pvc pipe which had been in service for 10 years. Hazen-Williams and Darcy-Weisbach equations were examined to provide a framework for comparing Hazen-Williams coefficients recommended by pipe manufacturers to those obtained by the field measurements. The conclusion was that the C sub HW of 150 recommended by most pvc pipe manufacturers is too high for the diameter-velocity combinations encountered in rural dead-end small diameter lines. The measured coefficients averaged 133, which is close to that predicted by superimposing Hazen-Williams coefficients on the Moody diagram from which the fricton factor for the Darcy-Weisbach equation is obtained. (Lee-ISWS)

AIR-REGULATED SIPHON SPILLWAYS AT SPELGA DAM,
Ferguson and McIlveen, Belfast (Northern Ireland).
F. F. Poskitt, and E. M. Elsaway.
Journal of the Institution of Water Engineers and Scientists, Vol. 30, No. 4, p 177-190, June 1976. 9 fig, 13 ref.

Descriptors: *Siphons, *Spillways, *Hydraulic structures, *Model studies, Hydraulic models, Flow control, Flow characteristics, Pressure, Water pressure, Negative pressure, Hydraulic similitude, Laboratory tests, Foreign research, *Ireland, *Spelga Dam(Ireland), Air-regulated siphon.

The Spelga Dam is a 30 m high, concrete, gravity dam constructed for water supply purposes in 1957 in the Mourne Mountains in Northern Ireland. Increasing water demand required raising the impoundment level without increasing dam height. Investigations resuled in a decision to replace the 2 existing profiled surface spillweirs with automatically priming and de-priming air-regulated saddle siphons. Hydraulic modes obtained on water discharge, air flow, and pressure distribution for various lip-lengths and lip-levels and different types of ski-jumps. Using these data, an optimum design was reached, and the influence of each parameter on siphon performance was gauged. When priming, models exhibit 4 phases of flow similar to those observed in other air-regulated siphons which can be summarized as: (1) Weir flow - When the reservoir water level reaches the siphon crest, water flows over the crest; and the nappe forms 4 airpockets within the siphon barrel and provides an air seal at its exit. (2) Subatomspheric weir flow - As the reservoir level continues to rise, air is prevented from gaining direct access to the siphon entrance as well as to its exit. (3) Partialized flow - In this phase, the siphon is partially primed, and draws in and becomes filled with an air/water mixture. Any small increases in level are followed by relatively large increases in water discharge. (4) Black-water flow - A continuing rise in level exhausts the remaining air from the siphon and prevents any further air being drawn in under its hood, and the siphon becomes fully primed and reaches black-water flow. On de-priming the cycle is revesed, and the model exhibited good air regulation and minimal loss of impounding level. The Spelga siphons enabled an increase of 600 Ml or 22% in storage capacity to be secured. (Humphreys-ISWS)

Descriptors: *Water waves, *Structures, *Hydraulic models, Ocean waves, Wave action, Concrete structures, Failures, Hydraulic similitude, Physical models, Mississippi, Model studies, Bridges, *Wave forces, *Causeways, Bay St Louis(Miss), Hurricane Camille.

A 1:24 scale model of the Bay St. Louis, Mississippi bridge was used for the determination of lift and drag forces and rolling moment caused by normal incidence waves. The bridge was damaged by Hurricane Camille in 1969. The Bay St. Louis Bridge is a causeway-type, four-lane bridge of beam and slab construction. Pairs of lanes are structurally separated. Wave forces and moment were determined separately for the seaward and landward pairs of lanes. Thirty pages of design curves are presented in dimensionless form for scaling to prototype dimensions. The study was made more applicable to other bridges of similar geometry by varying the height of the bridge deck above the bay bottom. Results predict observed anchorage failure in the Bay St. Louis bridge.

Descriptors: *Pumping plants, *Flow characteristics, *Minnesota, Hydraulic models, *Indian Creek pumping station(Minn).

Model study conducted to evaluate characteristics of inflow to the original design gravity-flow section and pump sump and to develop modification for improving the distribution of flow to the gravity-flow section and pump intakes. The 1:10-scale model indicated need for minor modification to improve flow characteristics in the forebay and ensure satisfactory flow characteristics and pressures near the pump intakes. Major problems at pump intakes were generated by the concentrated jet produced adverse currents and turbulence near pump intakes. Satisfactory approach flows were obtained by installing divider walls to isolate each pump. Major problems at entrance to the gravity-flow section were generated by abrupt transition from the forebay to the gravity-flow section. These were Alleviated by streamlining entrance to the gravity-flow section. Improved flow conditions at entrance to the gravity-flow section. Improved flow conditions at entrance to the gravity-flow section reduced severe drawdown at the right abutment and provided a more direct route for flow to enter the gravity-flow section. Improved flow conditions to pump intakes eliminated surface vortexes and reduced pressure fluctuations from about 3.6 ft of water with the original design to 1.0 ft of water with recommended design. WATER RESOURCES APPRAISAL FOR HYDROELECTRIC LICENSING, KERN RIVER BASIN, CALIFORNIA.
Federal Power Commission, Washington, DC. Bureau of Power.
1977. 83 p, 22 tab, 25 fig.

Descriptors: *Recreation facilities, *Hydroelectric power, *Multiple-purpose projects, *Cost-benefit analysis, *Economics, Hydroelectric project licensing, Reservoirs, Streamflow, Hydrology, Flood control, Irrigation, Amortization, Geology, Climate, Reservoir sites, Drainage, California, *Kern River Basin(CA), *Water service organizations, Water availability, Electric utility systems.

This report offers an extensive investigation of the Kern River Basin, its economy, its existing water and related land developments, its future economic and human needs, and possible future development and utilization of water resources. The Kern River Basin is located within Kern and Tulare Counties, CA. The water and related land resources of the Basin have been developed to a substantial degree for hydroelectric power, irrigation, flood control and recreational purposes. There are four hydroelectric power developments in the Basin located on the Kern River, one just above Isabella Lake and the other three in the canyon below the lake. The underdeveloped portions of the Basin include reservoir sites, opportunities for hydroelectric power development, and lands for future recreational expansion. In evaluating the potential multiple-purpose projects, the staff derived investment costs based on estimates contained in the Corps of Engineers' Draft Review Report on the Kern River Basin, July 20, 1966. These cost estimates were reviewed, modified, and updated as necessary. The annual costs used in the benefit-cost analyses include fixed charges, operation and maintenance expenses, and administration and general expenses. Project benefits considered included flood control, recreation, fish and wildlife enhancement, irrigation and hydroelectric power production. (Coan-NC)

HOT WATER RESERVOIR,
Aktiebolaget Atomenergi, Stockholm (Sweden). (Assignee).
P. H. E. Margen.
U.S. Patent No. 4,102,134, 6 p, 6 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 972, No 4, p 1403, July 25, 1978.

Descriptors: *Patents, *Reservoir construction, Impoundments, Surface waters, Heated water, Thermal insulation, Engineering structures, Barriers.

A hot water reservoir for a district heating plant may be a comparatively small one, for absorbing the variations in heat consumption between night and day, or it may be an extremely large one, for absoring the variations in heat consumption between summer and winter. The invention provides a simple and inexpensive hot water reservoir by using a flexible wall for enclosing a limited portion of a natural or artificial lake, sea bay or other body of water. The hot water reservoir comprises buoys floating on the surface of a lake and enclosing a limited area of the lake, a substantially vertical wal of a flexible material having its upper edge fastened to the buoys, weights fastened to the lower edge of the wal to maintain it in a vertical position, cables extending between the buoys and weights to reinforce the wall, and anchoring wires extending from the buoys toward the interior of the reservoir. The wall of the reservoir consists of two or more sheets substantially impervious to water and having stagnant water between them. They consist preferably of a fabric coated with plastic which can resist the temperature of the hot water. The loss of heat to the atmosphere is reduced by placing a heat insulating sheet to float on the hot water surface. (Sinha-OEIS)

8D. Soil Mechanics

STATE-OF-THE-ART APPLICABILITY OF CONVENTIONAL DENSIFICATION TECHNIQUES TO INCREASE DISPOSAL AREA STORAGE CAPACITY,
Army Engineer Waterways Experiment Station, Vicksburg, MS. Soils and Pavements Lab.
S. J. Johnson, R. W. Cunny, E. B. Perry, and L. Devay.
Available from the National Technical Informat Service, Springfield, VA 22161 as ADA-041 Price codes: A10 in paper copy, A01 in microfic Technical Report D-77-4, April 1977. 122 p, 59 34 tab, 75 ref, 4 append.

Descriptors: *Dredging, *Density stratificat *Storage, Disposal, Dikes, Seepage, Dewater Soil stabilization, Waste disposal, Rivers, S ments, *Densification techniques, Storage ca ity.

Dredging to maintain or increase project depth navigable channels and harbors often requires fined dredged material disposal areas. In m locations it is difficult to find suitable conf disposal areas, and even where available, envi mental constraints prevent or restrict their This study determined whether conventional s lization techniques can be used to densify dewater material as a means for increasing storage capacity of disposal areas. This was on a judgement basis and without laboratory field research. Coarse-grained material was included, thus restricting the study to clays silty clays which have high water contents placement in disposal areas. It was concluded conventional stabilization techniques can be to increase disposal area capacity but that eco ic constraints restrict their use in some areas. pendixes included a description of river sedim a general description of conventional densifica techniques, and calculations for the economic uation of densification techniques. age.

rmonics is the analysis of groundwater flow
ms based upon the redistribution of rising
hermal heat and/or shallow soil heat by
ing groundwater. Because grounddwater is
lly in motion, it may act as moving heat sink
eat source, the strength of which is related to
mass-rate of groundwater movement. Tem-
ure measurements at shallow depths in small
eter holes are usually sufficient to pin-point
ocations of wide zones or narrow fractures
ining groundwater moving at relatively high
Thermonics used in conjunction with frac-
trace analysis is probably the most powerful
od of locating fractures and solution features
rstic terrane which contains moving ground-
and which may pose problems in earthen
embankment stability. In 1971, a Thermonic
y of Wolf Creek Dam in Kentucky was made
e purpose of Determinig whether there were
ct zones of subflow in the dam foundation.
ination of both piezometric and Thermonic
nation indicated that piezometric information
is not sufficient to define the path of high
dwater flow. The most significant conclusion
ed was that the entire foundtion flow pattern
am foundation can be defined by Thermonics
to construction, provided the foundation is
ted. (See also W79-01932) (Humphreys-

HOW TO INSURE A GOOD BRIDGE PLUG JOB,
Welex, Venice, LA.
D. Prince.
Special Report, June, 1973, 1 p.

Descriptors: *Wells, *Cement plug, Oil spills, Well casings, Well permits, *Well plugs, *Bridge plug, Well cap, Dead well.

A widely used bridge plug employs delayed-time valve closing to allow gas agitation or fluid flow to continue while an initial cement dump sets. After solid set, the bleed-off valve is automatically closed by dual timers preset on the surface before running the plug. Additional cement can then be dumped if well conditions and plug requirements so indicate. The plug can set in operating wells under pressure or in dead wells. The former costs slightly more because of the complexities of working under pressure and the special material and equipment required. A plug job is not recommended immediately after (3 to 4 hours) a well has been killed; best results are usually obtained when the well has had a chance to stabilize for at least a day, preferable two or three. MANOEUVERABLE WEIR,
Pirelli Furlanis - Applicazioni Idrauliche Agricole Gomma S.p.A., Milan (Italy). (Assignee).
A. Colamussi, and V. Merli.
U.S. Patent No. 4,103,497, 5 p, 4 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 973, No 1, p 57, August 1, 1978.

Descriptors: *Patents, *Structures, *Weirs, Overflow, Streamflow, Water levels, Channels, Flow control.

A weir for damming water in a waterway comprises a base member placed on the bottom of the waterway and a pivotable flap member having a wall enclosing an elongated space adapted to contan air under pressure. The flap member has one end wal hinged to the base member and is inclined upward from its hinged end above the base member. The manoeuverable weir is characterized by the fact that it contains openings in the metallic flap from which conduits depart creating a water current. (Sinha-OEIS)

INFLUENCE OF KARST ON ENGINEERING IN IRELAND,
Geological Survey of Ireland and Minerex, Ltd., Dublin.
D. J. Burdon.
In: Hydrologic Problems in Karst Regions; Proceedings of Symposium held at Western Kentucky University, Bowling Green, Kentucky, April 26-29, 1976. Department of Geography and Geology, Western Kentucky University, Bowling Green, Kentucky, p 419-431, 1977. 1 fig, 30 ref.

Descriptors: *Karst, *Engineering, *Geomorphology, *Natural resources, Reviews, Geology, Carbonate rocks, Limestones, Lime, Gypsum, Sands, Gravels, Agriculture, Coasts, Lakes, Rivers, Groundwater, Foreign countries, *Ireland.

This report aimed at bringing together published information on the karst of Ireland as karst affects engineering works. The paper emphasized the mainly indirect effects of karst and karstification processes on engineering activities, rather than hydrology, hydrogeology, or groundwater development. The geology and geomorphological conditions of the affected area were introduced first--an area of carbonate rocks that extends over about half the land surface. Karstic influences on engineering works then were described under 3 major categories: water-soluble raw materials in quarrying and mining; non-water engineering works; and water-related engineering works. The paper concluded with 30 Irish references, all of which have been quoted or referred to in the text. This may be considered as a first attempt to bring together the scattered literature dealing with the geological problems encountered by the engineer working in those areas of Ireland which are unerlain by carbonate rocks. CONSTRUCTION METHODS WHICH RECOGNIZE THE MECHANICS OF SINKHOLE DEVELOPMENT,
Reitz and Jens, Inc., St. Louis, MD.
H. M. Reitz, and D. S. Eskridge.
In: Hydrologic Problems in Karst Regions; Proceedings of Symposium held at Western Kentucky University, Bowling Green, Kentucky, April 26-29, 1976. Department of Geography and Geology, Western Kentucky University, Bowling Green, Kentucky, p 432-438, 1977. 3 fig, 2 ref.

Descriptors: *Karst, *Sinks, *Rock properties, *Missouri, Soil mechanics, Construction, Foundation rocks, Carbonate rocks, Filters, Geomorphology, Fractures(Geologic), Land subsidence, Limestones, Methodology, Graded filters, Soil arching.

Sinkhole formation starts by loss of soil downward into fissures in the surface of bedrock from hydraulic pressure surges at times when the system of joint and bedding plane fissures is filled with groundwater. Tracts of karst topography can be developed best by preventing anything but infiltrating water from going beneath the ground and by building inverted graded filters, topped out with controlled fills over historic sinkhole locations. For rigid support of heavy column loads, horizontally stratified bedrock can be turned into an elastic continuum with selective investigations, and grouting for strength, not for watertightness, with the depth and nature of the investigation and

construction varying with the characteristics of the heavy structure to be supported. In summary, the dynamic character of sinkholes must be recognized. The fact that a filled sink can return to life from above as well as below was recognized in the treatment methods outlined. (See also W79-01932) (Humphreys-ISWS)

EVALUATION OF STREAM IMPROVEMENT PRACTICES IN SOUTHEASTERN TROUT STREAMS,
Oklahoma Cooperative Fisheries Research Unit, Stillwater.
O. E. Maughan, K. L. Nelson, and J. J. Ney.
Available from the National Technical Information Service, Springfield VA 22161 as PB-289 263, Price codes: A04 in paper copy, A01 in microfiche. Water Resources Research Center, Bulletin 115, September 1978. 67 p, 10 fig, 14 tab, 37 ref. OWRT A-067-VA(1).

Descriptors: *Stream habitat improvement, Virginia, *Stream improvement structures, Gabions, Southeast(US), Mountain Trout streams, Boulder emplacement, Log dams, Instream cover.

Most stream improvement techniques were designed and tested in the northern and western areas of the U.S., but little research has been done to evaluate the impact of these practices as they are used in the Southeast. This research evaluated the effects of stream rehabilitation devices on four southeastern Virginia trout streams. In both improved and reference sections of the streams, the study measured various physical parameters, and fish and benthic macroinvertebrate populations. Specifically, the streams were investigated to determine the effectiveness of stream improvement structures in providing increased habitat for trout and nongame species, and to determine the possible influences of the devices on aquatic invertebrates. The structure examined included log dams, gabion deflectors, and random boulder emplacements. In some cases, large pools were impounded above the dams; noticeable pool formation occurred below all dams. Runs and pools were associated with 11 of 18 gabions; the use of boulders to increase cover met with variable success. Fish biomass, trout biomass, and invertebrate numbers generally did not differ significantly between improved and reference sections. The utility of various stream improvement devices is dependent on their proper placement and on a correct assessment of their various limiting factors. Since each stream has a unique combination of biological, physical, and chemical parameters, stream improvement should be performed on a site-specific basis. This study should provide needed data for proper selection, design and installation of stream improvement structures.

Application of LANDSAT Image Wetl Study and Land Classification in West Tenn see,
W79-01638

The Verification of LANDSAT Data in Geographical Analysis of Wetlands in W Tennessee,
W79-01639

CLAY MINERALOGY
Physical, Chemical, and Mineralogical Prop ties of Fluvial Unconsolidated Bottom S ments in Northwestern Ohio,
W79-01926

CLIMATES
Analysis of Seasonal Persistence of Climat Nebraska,
W79-01538

IMATIC DATA
Crop Water Requirement in Relation to Climate nd Soil,
V79-01712 2G

IMATOLOGY
Solar Radiation and Urban Heat Islands,
V79-01568 2B

OVER CREEK (CA)
Flood Hazard Information: Clover Creek, Still-vater Creek and Stillwater Creek Tributaries, Loomis Corners, California.
V79-01851 4A

AGULATION
Removal of Color from Carbonate Pulping Ef-uent The Calcium-Magnesium Coagulation rocess,
V79-01769 5D

AL CREEK (OK)
lood Plain Information: Coal Creek and Tribu-ries, Henryetta, Oklahoma.
V79-01858 4A

ASTAL MARSHES
se of Landsat Data to Relate Water Depth to bserved Area of Inundation in Coastal arshes,
V79-01637 7B

ASTAL STRUCTURES
oating Breakwaters: An Idea Whose Time Has eturned,
79-01525 8B

ASTAL ZONE MANAGEMENT
mmary Report of the Pilot Study Program, reat Lakes Shoreland Damage Study,
79-01528 4A

inois Coastal Zone Management Program, 2nd ear Work Product, Vol. VI. Public Participa-n Activities by League of Women Voters, ortheastern Illinois Pln. Commission, Lake ichigan Federation.
79-01845 6B

STS
and Land Use Activities and Georgia's Coast-Waters.
79-01651 4C

nois Coastal Zone Management Program, 2nd ar Work Product, Vol. VI. Public Participa-n Activities by League of Women Voters, rtheastern Illinois Pln. Commission, Lake chigan Federation.
79-01845 6B

HRAN COUNTY (TEXAS)
alytical Study of the Ogallala Aquifer in chran County, Texas, Projections of Saturat-Thickness, Volume of Water in Storage, mpage Rates, Pumping Lifts, and Well Yields,
9-01930 7C

O SALMON
e Effects of Intermittent Chlorination on ho Salmon, Alewife, Spottail Shiner, and nbow Smelt,
9-01753 5C

E WASTE ACTIVATED SLUDGE
thod for Adenosine 5'-Triphosphate Mea-ement on Coke Waste Activated Sludge,
9-01723 5D

FORMS
ects of Chlorination on Differentiated Coli-n Groups,
9-01695 5C

COLONIAL BIRDS
Use of Dredged Material Islands by Colonical Seabirds and Wading Birds in New Jersey,
W79-01658 5E

COLOR
Removal of Color from Carbonate Pulping Effluent The Calcium-Magnesium Coagulation Process,
W79-01769 5D

Color Removal from Textile Dye Waste Using Magnesium Carbonate,
W79-01776 5D

COLORADO
Snowpack Ground Truth: Radar Test Site, Steamboat Springs, Colorado, April 8-16, 1976,
W79-01527 2C

Fluvial Adjustments to the Spread of Tamarisk in the Colorado Plateau Region,
W79-01919 2J

The Roles of Water Conservation Values in Community Policy,
W79-01987 3D

COLORADO RIVER
Summer Distribution and Reproductive Status of Fish of the Colorado River in Grand Canyon National Park and Vicinity, 1975,
W79-01585 6B

Investment Planning for Colorado River Salinity Control,
W79-01587 5G

COLUMBIA RIVER
Conceptual and Mathematical Modeling of the Hanford Groundwater Flow Regime,
W79-01522 5B

COMBINED SEWERS
The Contribution of Mercury and Chlorinated Organics from Urban Runoff,
W79-01918 5B

COMMUNITY DEVELOPMENT
The Roles of Water Conservation Values in Community Policy,
W79-01987 3D

COMPREHENSIVE PLANNING
Interim Report No. 2, Wabash River Basin Comprehensive Study Covering Reservoir Sites on Embarrass River, IL, and Clifty Creek and Patoka River, in, Vol. I: Report.
W79-01827 6B

Interim Report No. 2, Wabash River Basin Comprehensive Study Covering Reservoir Sites on Embarrass River, IL, and Clifty Creek and Patoka River, IN. Vol. II: Appendices A-C.
W79-01828 6B

Interim Report No. 2, Wabash River Basin Comprehensive Study Covering Reservoir Sites on Embarrass River, IL., and Clifty Creek and Patoka River, IN. Vol. III, Appendices D-F.
W79-01829 6B

Wabash River Basin Comprehensive Study. Vol I. Main Report,
W79-01830 6B

COMPUTER MODELS
Water Resources Planning for Rivers Draining into Mobile Bay,
W79-01510 4A

Parametric Study and Preliminary Evaluation of Reverse Osmosis for Seawater Desalination,
W79-01580 3A

Fertilization Decision Model-A Synthesis of Soil and Plant Parameters in a Computerized Program,
W79-01714 2G

Computer Model for Predicting Pollution in the Missouri,
W79-01905 5B

A Study of Parameter Estimation Procedures of a Model for Lake Phosphorus Dynamics,
W79-01994 5C

COMPUTER PROGRAMS
Fertilization Decision Model-A Synthesis of Soil and Plant Parameters in a Computerized Program,
W79-01714 2G

Pattern Recognition Techniques Applied to Oil Identification,
W79-01747 5A

COMPUTER STUDIES
A Manual for Hydrologic Time Series Deseasonalization and Serial Dependence Reduction,
W79-01989 7C

CONDENSATES
Characterization of Various Condensate Streams in the Kraft Process,
W79-01601 5D

Elimination of Impurities Contained in Kraft Mill Condensates (Badania nad usuwaniem zanieczyszczen wystepujacych w kondensatach z celulozowni siarczanowych),
W79-01602 5D

CONFERENCES
Sediment Control Conference, Held at Helena Montana on December 15, 1972.
W79-01523 4D

Hydrologic Problems in Karst Regions.
W79-01932 2F

CONNATE WATER
Comparative Studies on Extraction of Sediment Interstitial Waters: Discussion and Comment on the Current State of Interstitial Water Studies,
W79-01551 2K

CONNECTICUT
Analysis of Current Land-Use and Zoning Versus Selected Environmental Factors in Drainage Basins Containing Lakes or Ponds,
W79-01589 2H

CONSERVATION
Summer Distribution and Reproductive Status of Fish of the Colorado River in Grand Canyon National Park and Vicinity, 1975,
W79-01585 6B

The Roles of Water Conservation Values in Community Policy,
W79-01987 3D

CONSTRUCTION
Ecological Recovery of Realigned Stream Channels,
W79-01515 6G

Floating Breakwaters: An Idea Whose Time Has Returned,
W79-01525 8B

CONTAINMENT AREA
Weir Design to Maintain Effluent Quality from Dredged Material Containment Areas,
W79-01655 5G

CONTAINMENT AREAS
A Study of Leachate from Dredged Material in Upland Areas and/or in Productive Uses,
W79-01660 5B

CONTINGENCY PLANNING
Oil and Hazardous Substances Pollution Contingency Plan. Region VIII. Colorado, Montana, North Dakota, South Dakota, Utah, Wyoming.
W79-01842 5G

COOLING WATER
Zoobenthos in Thermal Discharge to Western Lake Erie,
W79-01675 5C

Power Plant Cooling Water Chlorination in Northern California,
W79-01676 5C

Bacterial Aerosols from Cooling Towers,
W79-01694 5C

Computing Evaporation for Inland Water Bodies under a Variety of Fetch and Atmospheric Stability Conditions,
W79-01895 2D

COPPER
Metal Concentrations (AS, CD, CU, PB and ZN) in Shorthorn Sculpins, Myoxocephalus Scorpius (Linnaeus) and Arctic Char, Salvelinus Alpinus (Linnaeus), From the Vicinity of Strathcona Sound, Northwest Territories,
W79-01552 5B

COPPER SULFATE
Consequences of Periodic Applications of Copper Sulfate and Simazine for Phytoplankton Control in Catfish Ponds,
W79-01672 5C

Citric Acid Enhancement of Copper Sulfate Toxicity to Blue-Green Algae and Other Nuisance Organisms,
W79-01906 5C

CORE SAMPLERS
Assembly for Mounting Hydraulic Soil Core Sampler on Tractor Front,
W79-01710 7B

CORN (FIELD)
Differences Among Genotypes of Corn in the Kinetics of P Uptake,
W79-01733 3F

Corn and Alfalfa Production as Influenced by Irrigation and Salinity,
W79-01734 3C

A Methodology for Testing the Accuracy of Yield Predictions from Weather-Yield Regression Models for Corn,
W79-01766 3F

Effects of Corn Stover, Manure, and Nitrogen on Soil Properties and Crop Yield,
W79-01781 3F

Effectiveness of Nitrapyrin in Controlling Nitrification of Fall and Spring-Applied Anhydrous Ammonia,
W79-01849 3F

CORSON INLET (NJ)
Numerical Simulation of Tidal Hydrodynamics, Great Egg Harbor and Corson Inlets, New Jersey,
W79-01661 2L

COST ALLOCATION
Interim Report No. 2, Wabash River Basin Comprehensive Study Covering Reservoir Sites on Embarrass River, IL, and Clifty Creek and Patoka River, IN. Vol. II: Appendices A-C.
W79-01828 6B

COST ANALYSIS
Feasibility of Recycling Laundry Wastewaters at Military Quartermaster Laundries,
W79-01574 5D

Water Supplies and Costs in Relation to Farm Resource Decisions and Profits on Sacramento Valley Farms,
W79-01737 6C

COST APPORTIONMENT
Interim Report No. 2, Wabash River Basin Comprehensive Study Covering Reservoir Sites on Embarrass River, IL, and Clifty Creek and Patoka River, IN. Vol. II: Appendices A-C.
W79-01828 6B

COST-BENEFIT ANALYSIS
Water Resources Appraisal for Hydroelectric Licensing, Kern River Basin, California.
W79-01835 8C

The Upper Columbia Navigation Proposal.
W79-01843 4A

COST COMPARISONS
Remote Sensing of Wetlands,
W79-01642 7B

COST EFFICIENCY
Model Aids Managerial Effectiveness in Municipal Water Systems,
W79-01741 5G

COST SHARING
Efficiency and Equity in Pricing Local Public Services: The Case of Wastewater,
W79-01544 5D

COSTS
Vehicle Washing Operations and Wastewater Discharges, Fort Drum, NY -- Findings and Recommendations,
W79-01573 5D

COTTON
Simulation of Nitrogen Processes in Soils for Estimating Fertilizer Requirements,
W79-01713 2K

COTTONWOOD CREEK (CA)
Flood Hazard Information: Sacramento River and Cottonwood and Battle Creeks, Cottonwood-Bend Area, California.
W79-01855 4A

COULOMETRIC TECHNIQUES
Part I: Application of Pulse Polarography and Pulse Anodic Stripping to the Determination of Selected Heavy Metals in Natural Waters--Part II: Application of Controlled Potential Coulometric Techniques to the Determination of Uranium,
W79-01517 5A

CRABS
The Influence of Constant and Cyclic Acclimation Temperatures on the Metabolic Rates of Panopeus Herbstii and Uca Pugilator,
W79-01685 5C

CROP PRODUCTION
Evaluation of Peat and Granular Inoculum for Soybean Yield and N Fixation Under Irrigation,
W79-01702 3F

Alfalfa Water Use and Production on Dryland and Irrigated Sandy Loam,
W79-01715 3F

Corn and Alfalfa Production as Influenced by Irrigation and Salinity,
W79-01734 3C

Effect of Slow Release Fertilizer on Fertilizer Residues and on Yield and Composition of Flue-Cured Tobacco,
W79-01736 3F

Water Supplies and Costs in Relation to Fa
Resource Decisions and Profits on Sacrame
Valley Farms,
W79-01737

Profile Modification of a Fragiudalf to Incre
Crop Production,
W79-01740

A Methodology for Testing the Accuracy
Yield Predictions from Weather-Yield Reg
sion Models for Corn,
W79-01766

Management of Irrigated Soybeans on a Mo
ately Coarse-Textured Soil in the Upper M
west,
W79-01775

Effects of Corn Stover, Manure, and Nitro
on Soil Properties and Crop Yield,
W79-01781

Fertilizer Placement Effects on Soybean S
Yield, N2 Fixation, and 33P Uptake,
W79-01782

Sunflower Yield and Water Use as Influenced
Planting Date, Population, and Row Spac
W79-01999

CROP RESPONSE
Corn and Alfalfa Production as Influenced
Irrigation and Salinity,
W79-01734

Differential Response of Soybean Varietie
Soil Cadmium,
W79-01826

CRUDE OIL
Effects of Crude Oils on the Growth of A
Marine Phytoplankton,
W79-01784

CULTIVATION
Sunflower Yield and Water Use as Influence
Planting Date, Population, and Row Spac
W79-01999

CYANIDES
Process for Removing Cyanide-Contai
Components from Aqueous Media,
W79-01884

CYANOPHYTA
Distribution of Bluegreen Algae in a Missis
Gulf Coast Salt Marsh,
W79-01750

Citric Acid Enhancement of Copper Su
Toxicity to Blue-Green Algae and Other
sance Organisms,
W79-01906

CYCLES
Nutrient Cycling and Productivity of Dy
phic Lake-Bog Systems (Part A) Appendi
The Influence of Colloidal Organic M
(COM) Upon Iron and Iron-Phosphorus Cy
in an Acid Bog Lake,
W79-01598

DADE COUNTY (FL)
Report of Waste Source Inventory and Ev
tion, Dade County, Florida.
W79-01834

DAM SAFETY PROGRAMS
Remote Sensing Assessment of Dam Floo
Hazards: Methodology Development for
New York State Dam Safety Program,
W79-01980

DAMS
Collapsible and Expansible Barrage,
W79-01869

Remote Sensing Assessment of Dam Flooding Hazards: Methodology Development for the New York State Dam Safety Program,
W79-01980 4A

ANE COUNTY (WISC)
Improvement and Evaluation of Techniques for the Mechanical Removal and Utilization of Excess Aquatic Vegetation,
W79-01584 4A

APHNIA
Biological Impact of Various Chlorinated Phenolics and Related Compounds on Daphnia Magna,
W79-01618 5C

ARDANELLE RESERVOIR (ARK)
A Preliminary Ecological Survey of Dardanelle Reservoir Prior to Nuclear Facility Effluent Discharge,
W79-01591 6G

ATA COLLECTIONS
Variations in the Duration of Stable Snow Cover in the USSR,
W79-01506 2C

Analytical Study of the Ogallala Aquifer in Terry County, Texas, Projections of Saturated Thickness, Volume of Water in Storage, Pumpage Rates, Pumping Lifts, and Well Yields,
W79-01927 7C

Analytical Study of the Ogallala Aquifer in Yoakum County Texas, Projections of Saturated Thickness, Volume of Water in Storage, Pumpage Rates, Pumping Lifts, and Well yields,
W79-01928 7C

Occurrence and Quality of Ground Water in Baylor County, Texas,
W79-01929 7C

Analytical Study of the Ogallala Aquifer in Cochran County, Texas, Projections of Saturated Thickness, Volume of Water in Storage, Pumpage Rates, Pumping Lifts, and Well Yields,
W79-01930 7C

Analytical Study of the Ogallala Aquifer in Lubbock County, Texas, Projections of Saturated Thickness, Volume of Water in Storage, Pumpage Rates, Pumping Lifts, and Well Yields,
W79-01931 7C

TA PROCESSING
Comparison of Field Data Collections to Data Collected Using Study Instruments in Muskegon and Manistee Counties, Michigan, Appendix VIII,
W79-01534 4A

TA TRANSMISSION
Environmental Analyses in the Kootenai River Region, Montana,
W79-01512 7B

CISION MAKING
Decision Making in a Multiple-Use Approach to the Reclamation of Strip-Mined Lands,
W79-01730 5G

Water Supplies and Costs in Relation to Farm Resource Decisions and Profits on Sacramento Valley Farms,
W79-01737 6C

COLORING
Decoloring of Water-Soluble Azo Dyes by Ozone (In Japanese),
W79-01599 5D

COMPOSING ORGANIC MATTER
Studies on the Decomposition of Allochthonous Detritus in Two Southern California Streams,
W79-01588 5B

Microfloral Response to Aquatic Weed Decomposition,
W79-01746 5C

DEEP SEA CORE DRILLING
Comparative Studies on Extraction of Sediment Interstitial Waters: Discussion and Comment on the Current State of Interstitial Water Studies,
W79-01551 2K

DELTAS
Combined Temperature-Salinity Effects on Grass Shrimp,
W79-01645 5C

DENITRIFICATION
Some Factors Affecting Denitrification in Soils Irrigated with Wastewater,
W79-01729 5E

Effectiveness of Nitrapyrin in Controlling Nitrification of Fall and Spring-Applied Anhydrous Ammonia,
W79-01849 3F

Nitrous Oxide in the Oxygen Minimum of the Eastern Tropical North Pacific: Evidence for its Consumption During Denitrification and Possible Mechanisms for its Production,
W79-01997 5C

DENSITIFICATION TECHNIQUES
State-of-the-Art Applicability of Conventional Densification Techniques to Increase Disposal Area Storage Capacity,
W79-01520 8D

DENSITY STRATIFICATION
State-of-the-Art Applicability of Conventional Densification Techniques to Increase Disposal Area Storage Capacity,
W79-01520 8D

DESALINATION
Parametric Study and Preliminary Evaluation of Reverse Osmosis for Seawater Desalination,
W79-01580 3A

Water Requirements and Desalting in the United States of America,
W79-01582 3A

Forward Osmosis Extractors: Theory, Feasibility and Design Optimization,
W79-01592 3A

Municipal Water Supply System,
W79-01863 3A

DESALINATION PLANTS
Municipal Water Supply System,
W79-01863 3A

DESERT PLANTS
Responses of Stomata and Water, Osmotic, and Turgor Potentials of Jojoba to Water and Salt Stress,
W79-01909 3C

DESIGN
Floating Breakwaters: An Idea Whose Time Has Returned,
W79-01525 8B

Vehicle Washing Operations and Wastewater Discharges, Fort Drum, NY -- Findings and Recommendations,
W79-01573 5D

Adventures in Designing for 1984 Effluent Reduction,
W79-01608 5G

DESIGN CRITERIA
Flood Frequency Design in Sparse-Data Regions,
W79-01901 4A

DESIGN FLOOD
Flood Frequency Design in Sparse-Data Regions,
W79-01901 4A

DESIGN WAVE
Design Wave Information for the Great Lakes; Report 5, Lake Superior,
W79-01662 8B

DETRITUS
Studies on the Decomposition of Allochthonous Detritus in Two Southern California Streams,
W79-01588 5B

DEWATERING
Mobile Centrifugal Unit for Use in Dewatering Paper Sludges (Die fahrbare Zentrifugenanlage beim Einsatz zur Entwaesserung von Papierschlaemmen),
W79-01606 5E

Process and Apparatus to Treat Putrefactive Waste from Raw Fish and Meat.
W79-01647 5D

DIAGENESIS
Dolomitization in the Floridan Aquifer,
W79-01749 2F

DIATOMS
Effects of Nutrient Enrichment of a Salt Marsh on Diatom Communities,
W79-01982 5C

DIFFERENTIAL EQUATIONS
A Finite Element Solution to a General Two-Dimensional Nonsymmetric Parabolic Partial Differential Equation,
W79-01559 2G

DIFFUSION
The Effects of Advection-Diffusion Processes on the Eutrophication of Large Lakes, a Hypothetical Example: Lake Superior,
W79-01993 5C

DIGESTION
Filter-Feeding Ethology of Benthic Invertebrates (Ascidians). V. Influence of Temperature on Pumping, Filtration, and Digestion Rates and Rhythms in Phallusia Mamillata,
W79-01653 5C

DIPTERA
Some Effects of Photoperiod, Temperature, and Food on Emergence in Three Species of Chironomidae (Diptera),
W79-01688 5C

Uptake of Zinc by the Aquatic Larvae of Simulium Ornatipes (Diptera: Nematocera),
W79-01696 5C

DIRECTORIES (PERSONNEL)
The Study of Environmental Public Policy: A Preliminary Directory,
W79-01569 6B

DISSOLVED GASES
Report on the Quality of the Water of the James River, South Dakota, 1970.
W79-01837 5G

DISSOLVED OXYGEN
Mathematical Models of Dissolved Oxygen Concentration in Fresh Water,
W79-01998 5C

DISTRIBUTION PATTERNS
Wetland Plant Communities Along the Eastern Shoreline of Lake Ontario,
W79-01644 2I

DIVERSITY INDEX
Biological Assessment of Water Quality in a Large River System: An Evaluation of a Method for Fishes,
W79-01553 5A

DOLINES
Distribution and Density of Dolines in Areas of Mantled Karst,
W79-01944 2F

Morphometric Analysis of Dolines for Predicting Ground Subsidence, Monroe County, West Virginia,
W79-01945 2F

DOLOMITE
Road Salts and Quality of Ground-Water from a Dolomite Aquifer in the Chicago Area,
W79-01968 5B

DOUGLAS COUNTY (WIS)
Great Lakes Shoreline Damage Survey; Brown, Douglas, and Racine Counties, Wisconsin, Appendix II,
W79-01530 4A

DRAINAGE BASIN ANALYSIS (LAKES)
Analysis of Current Land-Use and Zoning Versus Selected Environmental Factors in Drainage Basins Containing Lakes or Ponds,
W79-01589 2H

DRAWDOWN
Flow to a Well in an Unconfined Fractured Aquifer,
W79-01953 2F

DREDGED MATERIAL
Weir Design to Maintain Effluent Quality from Dredged Material Containment Areas,
W79-01655 5G

Use of Dredged Material Islands by Colonical Seabirds and Wading Birds in New Jersey,
W79-01658 5E

A Comparison of Plant Succession and Bird Utilization on Diked and Undiked Dredged Material Islands in North Carolina Estuaries,
W79-01659 5C

A Study of Leachate from Dredged Material in Upland Areas and/or in Productive Uses,
W79-01660 5B

DREDGED MATERIAL DISPOSAL
Effects of Turbidity and Suspended Material in Aquatic Environments, Literature Review,
W79-01656 5C

Aquatic Disposal Field Investigations, Ashtabula River Disposal Site, Ohio; Evaluative Summary,
W79-01657 5E

DREDGING
State-of-the-Art Applicability of Conventional Densification Techniques to Increase Disposal Area Storage Capacity,
W79-01520 8D

DRIP IRRIGATION
Mainline Installation,
W79-01689 3F

Drip Irrigation at Superior Farming: Water Use Cut 30%, Fertilizer 50% by This Large Corporate Farm,
W79-01690 3F

DROUGHT TOLERANCE
Responses of Stomata and Water, Osmotic, and Turgor Potentials of Jojoba to Water and Salt Stress,
W79-01909 3C

DRYING
Alternate Drying and Rewetting Effects on Chemical and Physical Properties and Moisture-Salinity Relationships of a Histosol,
W79-01699 2G

DUMPING
Fields of Use and Application of Manure and Manure Disposal, (In German),
W79-01633 5E

DYES
Decoloring of Water-Soluble Azo Dyes by Ozone (In Japanese),
W79-01599 5D

Organic Impurities from Industrial Waste Water Removal - By Treatment with Activated Carbon Containing Manganese Oxide(s) Useful in Chemical Industry.
W79-01703 5D

Color Removal from Textile Dye Waste Using Magnesium Carbonate,
W79-01776 5D

ECOLOGICAL DISTRIBUTION
Distribution and Production of Sago Pondweed (Potamogeton Pectinatus L.) on a Northern Prairie Marsh,
W79-01629 2I

Distribution of Bluegreen Algae in a Mississippi Gulf Coast Salt Marsh,
W79-01750 5C

ECOLOGICAL IMPACT
Environmental Assessment of Water Quality Management Plans.
W79-01844 5G

ECOLOGICAL SURVEYS
A Preliminary Ecological Survey of Dardanelle Reservoir Prior to Nuclear Facility Effluent Discharge,
W79-01591 6G

ECOLOGY
Texas Coastal Management Program Ecological Systems Component, User's Manual.
W79-01787 5C

ECONOMIC DEVELOPMENT
Interim Report No. 2, Wabash River Basin Comprehensive Study Covering Reservoir Sites on Embarrass River, IL, and Clifty Creek and Patoka River, IN. Vol. II: Appendices A-C.
W79-01828 6B

ECONOMIC FEASIBILITY
Physical and Economic Feasibility of Nonstructural Flood Plain Management Measures,
W79-01833 6F

ECONOMIC IMPACT
Energy Resources Development in Wyoming's Powder River Basin: An Assessment of Potential Social and Economic Impacts,
W79-01545 6B

Environmental Assessment of Water Quality Management Plans.
W79-01844 5G

The Impact of Energy Shortage and Cost on Irrigation for the High Plains and Trans Pecos Regions of Texas,
W79-01894 3F

An Economic and Environmental Evaluation of Alternative Land Development Around New Hampshire Lakes,
W79-01904 5G

ECONOMICS
Livestock Farming and Environmental Protec tion, (In German),
W79-01605 5I

Water Supplies and Costs in Relation to Farr Resource Decisions and Profits on Sacrament Valley Farms,
W79-01737 6

Interim Report No. 2, Wabash River Basi Comprehensive Study Covering Reservoir Site on Embarrass River, IL, and Clifty Creek an Patoka River, IN. Vol. II: Appendices A-C
W79-01828 6

Water Resources Appraisal for Hydroelectri Licensing, Kern River Basin, California.
W79-01835 8

Water Conservation in the Las Vegas Valley Pricing and Alternative Measures,
W79-01896 3I

ECOSYSTEM CHARACTERIZATION
Report of a Workshop on the Impact of Therm Power Plant Cooling Systems on Aquatic Env ronments, Vol. I. Working Group Results,
W79-01755 5

ECOSYSTEMS
Design of Field Experiments to Determine th Ecological Effects of Petroleum in Intertid Ecosystems,
W79-01810 5

Trawl Survey of the Epifaunal Invertebrates Norton Sound, Southeastern Chukchi Sea, ar Kotzebue Sound,
W79-01817 5

EFFLUENT
Report of Waste Source Inventory and Evalu tion, Dade County, Florida.
W79-01834 5

EFFLUENTS
Weir Design to Maintain Effluent Quality fro Dredged Material Containment Areas,
W79-01655 5

Public Hearing on the Draft Environmen Impact Statement Relating to Palm Bea County Sewage Treatment Improvement Pr gram.
W79-01839 5

ELECTRICAL CONDUCTANCE
Alternate Drying and Rewetting Effects Chemical and Physical Properties and Moistu Salinity Relationships of a Histosol,
W79-01699 2

ELECTRONIC EQUIPMENT
Remote Sensing of Water Levels in Small-Dia eter Wells,
W79-01924

EMBARRASS RIVER (IL)
Interim Report No. 2, Wabash River Ba Comprehensive Study Covering Reservoir Si on Embarrass River, IL., and Clifty Creek a Patoka River, IN. Vol. III, Appendices D-
W79-01829

EMPLOYMENT
Energy Resources Development in Wyomin Powder River Basin: An Assessment of Poten Social and Economic Impacts,
W79-01545

ENDANGERED SPECIES
Environmental Status of the Lake Michig Region, Volume 11. Natural Areas of the La Michigan Drainage Basin and Endangered Threatened Plant and Animal Species,
W79-01555

ERGY CONVERSION
How They're Harnessing the Sun to Pump Water,
W79-01679 3F

ERGY COSTS
The Impact of Energy Shortage and Cost on rrigation for the High Plains and Trans Pecos Regions of Texas,
W79-01894 3F

ERGY DEVELOPMENT
Energy Resources Development in Wyoming's Powder River Basin: An Assessment of Potential ocial and Economic Impacts,
W79-01545 6B

GINEERING

W79-01820 5C

Demersal Fish and Shellfish Resources of the Gulf of Alaska from Cape Spencer to Unimak Pass 1948 - 1976. A Historical Review. Volume 3,
W79-01821 5C

Community Structure, Distribution, and Interrelationships of Marine Birds in the Gulf of Alaska,
W79-01823 5C

Environmental Assessment of Water Quality Management Plans.
W79-01844 5G

Harry's Brook - A Surveillance Report of Physical Conditions and Biological Health,
W79-01907 5C

ENVIRONMENTAL IMPACT ASSESSMENT
Major Element Geochemistry of Lake Powell,
W79-01511 2H

ENVIRONMENTAL IMPACTS
Public Hearing on the Draft Environmental Impact Statement Relating to Palm Beach County Sewage Treatment Improvement Program.
W79-01839 5D

Public Hearing on the Draft Environmental Impact Statement Relating to Palm Beach County Sewage Treatment Improvement Program.
W79-01840 5D

ENZYMES
Optimize the Effluent System. Part 6: Biochemistry of Activated Sludge Process.
W79-01759 5D

EQUATIONS (EVAPORATION)
Computing Evaporation for Inland Water Bodies under a Variety of Fetch and Atmospheric Stability Conditions,
W79-01895 2D

EQUILIBRIUM
Possible Changes in Aerosol Composition Due to Departure from Equilibrium Conditions During Sampling.
W79-01554 5A

EROSION
Summary Report of the Pilot Study Program, Great Lakes Shoreland Damage Study,
W79-01528 4A

Great Lakes Shoreline Damage Survey, Saint Louis County, Minnesota, Appendix I.
W79-01529 4A

Comparison of Field Data Collections to Data Collected Using Study Instruments in Muskegon and Manistee Counties, Michigan, Appendix VIII,
W79-01534 4A

EROSION CONTROL
A Study of Articulated Concrete Revetment Mattress: Test and Analysis--Results of FY 1975 Program,
W79-01513 8F

Sediment Control Conference, Held at Helena Montana on December 15, 1972.
W79-01523 4D

ESTIMATING
A Study of Parameter Estimation Procedures of a Model for Lake Phosphorus Dynamics,
W79-01994 5C

ESTUARIES
Three-Dimensional Flow Simulation in Estuaries,
W79-01524 2L

Combined Temperature-Salinity Effects on Grass Shrimp,
W79-01645 5C

A Comparison of Plant Succession and Bird Utilization on Diked and Undiked Dredged Material Islands in North Carolina Estuaries,
W79-01659 5C

Applications of Mixing Experiments to Estuaries,
W79-01911 2L

ESTUARINE ENVIRONMENT
Water Resources Planning for Rivers Draining into Mobile Bay,
W79-01510 4A

EUTROPHICATION
Microfloral Response to Aquatic Weed Decomposition,
W79-01746 5C

Reclamation of Polluted Farm Ponds,
W79-01988 5G

The Effects of Advection-Diffusion Processes on the Eutrophication of Large Lakes, a Hypothetical Example: Lake Superior,
W79-01993 5C

A Study of Parameter Estimation Procedures of a Model for Lake Phosphorus Dynamics,
W79-01994 5C

Eutrophication of Water Bodies: Insights for an Age-Old Problem,
W79-02000 5C

EVALUATION
Preliminary Evaluation of the Water Quality of Proposed Towanda Lake, Kansas.
W79-01666 5A

EVAPORATION
Liquid Waste Processing System,
W79-01890 5D

EVAPORATION CONTROL
Development and Evaluation of Improved Films for Suppressing Water Evaporation,
W79-01537 3B

EVAPORATION LAKES
Computing Evaporation for Inland Water Bodies under a Variety of Fetch and Atmospheric Stability Conditions,
W79-01895 2D

EVAPOTRANSPIRATION
Application of Remote Sensing in Estimating Evapotranspiration in the Platte River Basin,
W79-01521 7B

Radiation and Energy Balance of Sprinkler and Trickle Irrigated Fields,
W79-01990 3F

EXPLOITATION
Current Problems in the Rational Exploitation of Karst Water,
W79-01958 2F

EXPLORATION
A Preliminary Investigation on Seismic Techniques Used to Locate Cavities in Karst Terrains,
W79-01940 2F

Geophysical Investigations Over Karst Water in Southeastern Missouri,
W79-01942 2F

Hydrogeology of a Cave Utilized for Public Water Supply: Rio Camuy Cave, Puerto Rico, U.S.A.,
W79-01957 2F

Exploration and Environmental Investigation of the Peacock Springs Cave System,
W79-01961 2F

FACIES
Dolomitization in the Floridan Aquifer,
W79-01749 2F

FACILITIES
The NOAA National Analytical Facility -- A Status Report,
W79-01806 5C

FARM PONDS
Reclamation of Polluted Farm Ponds,
W79-01988 5G

FARM WASTE
Utilization and Disposal of Liquid Manure at Small Available Space, (In German),
W79-01640 5E

FARM WASTES
Livestock Farming and Environmental Protection, (In German),
W79-01605 5D

Liquid Manure and Environment Protection, (In German),
W79-01628 5E

Fields of Use and Application of Manure and Manure Disposal, (In German),
W79-01633 5E

Feedlot Pollution: A Solvable Problem.
W79-01671 5B

FAULTS (GEOLOGIC)
Faults as Positive and Negative Influences on Ground-Water Flow and Conduit Enlargement,
W79-01951 2F

FEASIBILITY STUDIES
The Upper Columbia Navigation Proposal.
W79-01843 4A

FEEDING RATES
Feeding and Growth Rates of Polinices Duplicatus Preying on Mya Arenaria at Barnstable Harbor, Massachusetts,
W79-01669 5C

FEEDLOTS
Feedlot Pollution: A Solvable Problem.
W79-01671 5B

Report on the Quality of the Water of the James River, South Dakota, 1970.
W79-01837 5G

FEEDS
Improvement and Evaluation of Techniques for the Mechanical Removal and Utilization of Excess Aquatic Vegetation,
W79-01584 4A

FERNS
Genetic Damage to a Fern Population Growing in a Polluted Environment: Segregation and Description of Gametophyte Mutants,
W79-01745 5C

FERTILIZATION
Fertilization Decision Model-A Synthesis of Soil and Plant Parameters in a Computerized Program,
W79-01714 2G

Alfalfa Water Use and Production on Dryland and Irrigated Sandy Loam,
W79-01715 3F

Effect of Fertilization on Penncross Creeping Bentgrass,
W79-01754 3F

Effects of Cultural Practices on Grain Yield of Irrigated Wheat,
W79-01761 3F

Relationship Between Soil Test and Small Grain Response to P Fertilization in Field Experiments,
W79-01786 3F

Forage Yield and Fertilizer Recovery by Three Irrigated Perennial Grasses as Affected by N Fertilization,
W79-01885 3F

Nitrogen Losses from Sprinkler-Applied Nitrogen Fertilizer,
W79-01893 3F

FERTILIZERS
Fields of Use and Application of Manure and Manure Disposal, (In German),
W79-01633 5E

Nutrient Uptake by Grass and Leaching Losses from Soluble and S-Coated Urea and KCl,
W79-01705 3F

Nitrapyrin Degradation and Movement in Soil,
W79-01706 2G

Improved Techniques for Marking and Sampling Band-Applied Fertilizers and Pesticides,
W79-01709 5A

Simulation of Nitrogen Processes in Soils for Estimating Fertilizer Requirements,
W79-01713 2K

Effect of Slow Release Fertilizer on Fertilizer Residues and on Yield and Composition of Flue-Cured Tobacco,
W79-01736 3F

Effects of Corn Stover, Manure, and Nitrogen on Soil Properties and Crop Yield,
W79-01781 3F

Fertilizer Placement Effects on Soybean Seed Yield, N2 Fixation, and 33P Uptake,
W79-01782 3F

Nitrogen Losses from Sprinkler-Applied Nitrogen Fertilizer,
W79-01893 3F

FETCH LENGTH
Computing Evaporation for Inland Wate Bodies under a Variety of Fetch and Atmos pheric Stability Conditions,
W79-01895 2I

FIBERBOARD MILLS
Potential for an Improved Return on Investmer in the Production of Wood Fiberboard Usin the Wet Process (Moznosti zvysenia efektivnos vyroby drevovlaknitych dosak mokrym spos bom),
W79-01595 5I

FIBERS (PLANT)
Use in the Brick Industry of Highly Discolore Fibers Recovered from the Final Effluent Clar fier of a Paper Mill (Verwertung von stark ve faerbtem Fangstoff aus der Rest-abwasserklae anlage einer Papierfabrik in der Ziegelindustrie
W79-01607 3

FIELD SPREADING
Liquid Manure and Environment Protection, (I German),
W79-01628 5

FILTERS
Disk Filters for Effluent Purification (Diskov fil'try dlya ochistki stochnykh vod),
W79-01594 5

FILTRATION
Filter-Feeding Ethology of Benthic Invert brates (Ascidians). V. Influence of Temperatu on Pumping, Filtration, and Digestion Rates a Rhythms in Phallusia Mamillata,
W79-01653 5

Liquid Waste Processing System,
W79-01890 5

FINITE DIFFERENCE METHOD
A Finite Element Weighted Residual Solution One-Dimensional Field Problems,
W79-01558 2

FINITE ELEMENT ANALYSIS
Two-Dimensional Unsteady Water Flow in U saturated Porous Media,
W79-01556 2

Transient Two-Dimensional Problems Utilizi the Least Squares Algorithm,
W79-01557 2

A Finite Element Weighted Residual Solution One-Dimensional Field Problems,
W79-01558 2

A Finite Element Solution to a General Tw Dimensional Nonsymmetric Parabolic Part Differential Equation,
W79-01559 2

Finite Element Solution of Two-Dimensio Unsteady and Unsaturated Flow in Poro Media.
W79-01560 2

FISH DISEASES
The Effects of Alaskan Crude Oil on Flatfi and the Prevalence of fish Pathology in Alask Marine Waters.
W79-01793

FISH POPULATIONS
Ecological Recovery of Realigned Stre Channels,
W79-01515 4

Summer Distribution and Reproductive Sta of Fish of the Colorado River in Grand Cany National Park and Vicinity, 1975,
W79-01585

SH REPRODUCTION
Summer Distribution and Reproductive Status of Fish of the Colorado River in Grand Canyon National Park and Vicinity, 1975,
W79-01585 6B

LOATING BREAKWATERS
Floating Breakwaters: An Idea Whose Time Has Returned,
W79-01525 8B

Floating Breakwater Field Assessment Program, Friday Harbor, Washington,
W79-01526 8B

LOCCULATION
Studies of Flocculation and Sedimentation Treatment of Pulp Mill Effluent (Part 3) - Recovery and Reuse of Alum Sludge (Parupu haisui gyoshu shoriho no kenkyu (daisanpo) - ryusan aruminyumu shori suraji no kurozu ka shori),
W79-01758 5E

LOOD CONTROL
Remote Sensing Assessment of Dam Flooding Hazards: Methodology Development for the New York State Dam Safety Program,
W79-01980 4A

LOOD DAMAGE REDUCTION
Cost Report on Non-Structural Flood Damage Reduction Measures for Residential Buildings within the Baltimore District,
W79-01832 6F

LOOD DATA
Flood Plain Information: Salt Creek and Tributaries, Olney, Texas.
W79-01852 4A

Flood Plain Information: Frankstown Branch, Juniata River, Claysburg, Pennsylvania.
W79-01853 4A

Flood Plain Information: Bird Creek and Tributaries, Pawhuska, Oklahoma.
W79-01856 4A

Flood Plain Information: Provo River and Slate Canyon Creek, Provo, Utah.
W79-01857 4A

Flood Plain Information: Coal Creek and Tributaries, Henryetta, Oklahoma.
W79-01858 4A

Flood Plain Information: Panther and Bear Branches, Montgomery County, Texas.
W79-01859 4A

LOOD FORCASTING
Flood Plain Information: Pigeon Creek, Bentleyville, Fallowfield Township and Somerset Township, Pennsylvania.
W79-01850 4A

LOOD FORECASTING
Flood Hazard Information: Clover Creek, Stillwater Creek and Stillwater Creek Tributaries, Loomis Corners, California.
W79-01851 4A

LOOD FREQUENCY
Flood Frequency Design in Sparse-Data Regions,
W79-01901 4A

LOOD INSURANCE
Physical and Economic Feasibility of Nonstructural Flood Plain Management Measures,
W79-01833 6F

LOOD PLAIN MANAGEMENT
Physical and Economic Feasibility of Nonstructural Flood Plain Management Measures,
W79-01833 6F

FLOOD PLAIN ZONING
Physical and Economic Feasibility of Nonstructural Flood Plain Management Measures,
W79-01833 6F

FLOOD PROFILES
Flood Hazard Information: Sacramento River and Cottonwood and Battle Creeks, Cottonwood-Bend Area, California.
W79-01855 4A

Flood Plain Information: Bird Creek and Tributaries, Pawhuska, Oklahoma.
W79-01856 4A

Flood Plain Information: Provo River and Slate Canyon Creek, Provo, Utah.
W79-01857 4A

Flood Plain Information: Coal Creek and Tributaries, Henryetta, Oklahoma.
W79-01858 4A

FLOOD PROTECTION
Cost Report on Non-Structural Flood Damage Reduction Measures for Residential Buildings within the Baltimore District,
W79-01832 6F

FLOOD STAGES
Flood Plain Information: Muddy Branch, Montgomery County Maryland.
W79-01854 4A

FLOODPROOFING
Cost Report on Non-Structural Flood Damage Reduction Measures for Residential Buildings within the Baltimore District,
W79-01832 6F

FLORAL LISTS
Marine Algal Vegetation in Shallow Water Around the Danish Island of Saltholm, the Sound,
W79-01996 5C

FLORIDA
Preserving the Heritage of Gasparilla Island, an Approach to Conservation of the Economic, Cultural, Historical, and Natural Resources of the Island,
W79-01646 6G

Streptococcus Sp. from Marine Fishes Along the Alabama and Northwest Florida Coast of the Gulf of Mexico,
W79-01698 5C

Public Hearing on the Draft Environmental Impact Statement Relating to Palm Beach County Sewage Treatment Improvement Program.
W79-01839 5D

Exploration and Environmental Investigation of the Peacock Springs Cave System,
W79-01961 2F

FLOTATION
Feasibility of Recycling Laundry Wastewaters at Military Quartermaster Laundries,
W79-01574 5D

Process and Apparatus for Introducing Gas Bubbles into a Liquid (Procede et dispositif pour introduire des bulles gazeuses dans un liquide),
W79-01596 5D

FLOW
Three-Dimensional Flow Simulation in Estuaries,
W79-01524 2L

FLOW CHARACTERISTICS
Indian Creek Pumping Station, Mankato, Minnesota; Hydraulic Model Investigation,
W79-01663 8C

FLOW CONTROL
Flow Control Device for an Irrigation Ditch,
W79-01868 3F

FLOW RATES
Mass Transfer in Packed Beds with Two-Phase Flow,
W79-01567 2K

FOAM SEPARATION
Toxicity Removed by Foam Separation,
W79-01770 5D

FOOD ABUNDANCE
Some Effects of Photoperiod, Temperature, and Food on Emergence in Three Species of Chironomidae (Diptera),
W79-01688 5C

FOOD CHAINS
Characteristics and Use of Nonsetteable Solids by an Aquatic Food Chain Organism,
W79-01617 5C

Transport, Retention, and Effects of the Water-Soluble Fraction of Cook Inlet Crude Oil in Experimental Food Chains,
W79-01797 5C

FOOD HABITS
Food and Feeding Relationships in the Benthic and Demersal Fishes of the Gulf of Alaska and Bering Sea,
W79-01813 5C

FORAGE GRASSES
Forage Yield and Fertilizer Recovery by Three Irrigated Perennial Grasses as Affected by N Fertilization,
W79-01885 3F

FORCED CONVECTION
Computing Evaporation for Inland Water Bodies under a Variety of Fetch and Atmospheric Stability Conditions,
W79-01895 2D

FORECASTING
Analysis of Seasonal Persistence of Climate in Nebraska,
W79-01538 2B

Computer Model for Predicting Pollution in the Missouri,
W79-01905 5B

FOREST HABITAT
Ecology and Pathology of Wildlife in Response to Spray Irrigation of Chlorinated Sewage Effluent - Phase I,
W79-01902 5C

FORMALDEHYDE
Process for Detoxification of Formaldehyde Containing Waste Waters,
W79-01876 5D

FORWARD OSMOSIS
Forward Osmosis Extractors: Theory, Feasibility and Design Optimization,
W79-01592 3A

FRANCE
How and Why We Chose Integral Recycling (At the Isorel Fiberboard Plant, Castlejaloux, France),
W79-01622 3E

FREDERICK VALLEY (MD)
Water Well Productivity Related to Photo-Lineaments in Carbonates of Frederick Valley, Maryland,
W79-01954 2F

FREE CONVECTION
Computing Evaporation for Inland Water Bodies under a Variety of Fetch and Atmospheric Stability Conditions,
W79-01895 2D

FREEZE CONCENTRATION
Treatment of Bleach Plant Effluents by Combined Reverse Osmosis and Freeze Concentration Process,
W79-01610 5D

FRESHWATER FISH
The Effects of Intermittent Chlorination on Coho Salmon, Alewife, Spottail Shiner, and Rainbow Smelt,
W79-01753 5C

FRICTION
Hydraulic Friction Loss in Small Diameter Plastic Pipelines,
W79-01915 8B

FRIDAY HARBOR (WASH)
Floating Breakwater Field Assessment Program, Friday Harbor, Washington,
W79-01526 8B

FROUDE NUMBER
Applications of Mixing Experiments to Estuaries,
W79-01911 2L

FROZEN SOILS
An Analysis of Sensible and Latent Heat Flow in a Partially Frozen Unsaturated Soil,
W79-01711 2G

FUNGAL DEGRADATION
Fungal Degradation of Anaerobically Digested Sewage Sludge,
W79-01547 5E

FUNGI
Mycoflora of Activated Sewage Sludge,
W79-01548 5E

GALERKIN METHOD
A Finite Element Solution to a General Two-Dimensional Nonsymmetric Parabolic Partial Differential Equation,
W79-01559 2G

GALLIONELLA
Occurrence of Iron Bacteria in Ground Water Supplies of Alabama,
W79-01908 5B

GAMMA RAYS
A Gamma-Ray Counting Apparatus for Evaluating the Fallout Removal Effectiveness of Reverse-Osmosis Water Purification Systems,
W79-01576 5D

GAS-TO-LIQUID MASS TRANSFER
Mass Transfer in Packed Beds with Two-Phase Flow,
W79-01567 2K

GAS-TO-LIQUID TRANSFER
Trickle-Bed Reactor Performance, Part 1: Holdup and Mass Transfer Effects,
W79-01565 5D

GASES
Possible Changes in Aerosol Composition Due to Departure from Equilibrium Conditions During Sampling,
W79-01554 5A

GASPARILLA ISLAND (FLA)
Preserving the Heritage of Gasparilla Island, an Approach to Conservation of the Economic, Cultural, Historical, and Natural Resources of the Island,
W79-01646 6G

GENETICS
Genetic Damage to a Fern Population Growing in a Polluted Environment: Segregation and Description of Gametophyte Mutants,

Dolomitization in the Floridan Aquifer,
W79-01749 2F

Model Analysis of Closed Systems in Karstic Aquifers,
W79-01952 2F

Flow to a Well in an Unconfined Fractured Aquifer,
W79-01953 2F

Use of Thermonics in Foundation Studies in Karstic Terrane,
W79-01977 8E

GROUNDWATER POTENTIAL
Groundwater Potential of the Karst Regions of Alberta, Canada,
W79-01955 2F

Current Problems in the Rational Exploitation of Karst Water,
W79-01958 2F

GROUNDWATER PROTECTION
A Nonstructural Approach to Control Salt Accumulation in Ground Water,
W79-01735 5G

GROUNDWATER RECHARGE
Experience in Artificial Ground-Water Recharge for Water Supply in Lithuania,
W79-01508 4B

GROUNDWATER RESOURCES
Dolomitization in the Floridan Aquifer,
W79-01749 2F

Analytical Study of the Ogallala Aquifer in Terry County, Texas, Projections of Saturated Thickness, Volume of Water in Storage, Pumpage Rates, Pumping Lifts, and Well Yields,
W79-01927 7C

Analytical Study of the Ogallala Aquifer in Yoakum County Texas, Projections of Saturated Thickness, Volume of Water in Storage, Pumpage Rates, Pumping Lifts, and Well yields,
W79-01928 7C

Analytical Study of the Ogallala Aquifer in Cochran County, Texas, Projections of Saturated Thickness, Volume of Water in Storage, Pumpage Rates, Pumping Lifts, and Well Yields,
W79-01930 7C

Analytical Study of the Ogallala Aquifer in Lubbock County, Texas, Projections of Saturated Thickness, Volume of Water in Storage, Pumpage Rates, Pumping Lifts, and Well Yields,
W79-01931 7C

Ground-Water Development Problems Associated with Folded Carbonate-Rock Aquifers in the Irondale Area, Alabama,
W79-01956 2F

Hydrological Problems of Jufra Well Field, Libya,
W79-01963 2F

GROWTH RATES
Feeding and Growth Rates of Polinices Duplicatus Preying on Mya Arenaria at Barnstable Harbor, Massachusetts,
W79-01669 5C

Olisthodiscus Luteus (Chrysophyceae) I. Effects of Salinity and Temperature on Growth, Mortility and Survival,
W79-01682 5C

GULF OF ALASKA
Environmental Assessment of the Alaskan Continental Shelf Final Reports of Principal Investigators, Vol 2. Biological Studies.
W79-01818 5C

Demersal Fish and Shellfish Resources of the Gulf of Alaska from Cape Spencer to Unimak Pass 1948 - 1976. A Historical Review. Volume 1,
W79-01819 5C

Demersal Fish and Shellfish Resources of the Gulf of Alaska from Cape Spencer to Unimak Pass 1948 - 1976. A Historical Review. Volume 2,
W79-01820 5C

Demersal Fish and Shellfish Resources of the Gulf of Alaska from Cape Spencer to Unimak Pass 1948 - 1976. A Historical Review. Volume 3,
W79-01821 5C

GULF OF MEXICO
Streptococcus Sp. from Marine Fishes Along the Alabama and Northwest Florida Coast of the Gulf of Mexico,
W79-01698 5C

GYPSUM
Factors Affecting Gypsum and Cation Exchange Capacity Determinations in Gypsiferous Soils,
W79-01716 2K

HABITAT ALTERATION
Ecology and Pathology of Wildlife in Response to Spray Irrigation of Chlorinated Sewage Effluent - Phase I,
W79-01902 5C

HANFORD ATOMIC RESERVATION (WASH)
Conceptual and Mathematical Modeling of the Hanford Groundwater Flow Regime,
W79-01522 5B

HARBORS
Effects of Construction of Liberty State Park on Hydraulic Characteristics of New York Harbor; Hydraulic Model Investigation,
W79-01518 8B

HARDBOARD MILLS
How and Why We Chose Integral Recycling (At the Isorel Fiberboard Plant, Castlejaloux, France),
W79-01622 3E

HARDWOOD
Some Factors Affecting Denitrification in Soils Irrigated with Wastewater,
W79-01729 5E

HARRY'S BROOK (NJ)
Harry's Brook - A Surveillance Report of Physical Conditions and Biological Health,
W79-01907 5C

HARVESTING
The Production of Pulp from Marsh Grass.
W79-01630 4A

HAZARDS
Remote Sensing Assessment of Dam Flooding Hazards: Methodology Development for the New York State Dam Safety Program,
W79-01980 4A

HEAT FLOW
An Analysis of Sensible and Latent Heat Flow in a Partially Frozen Unsaturated Soil,
W79-01711 2G

HEATED BIURET-FOLIN METHOD
Measurements of Phytoplankton-Protein Content with the Heated Biuret-Folin Assay,
W79-01995 5A

HEAVY METAL ENRICHMENT
Physical, Chemical, and Mineralogical Properties of Fluvial Unconsolidated Bottom Sediments in Northwestern Ohio,
W79-01926 2J

HEAVY METALS
Part I: Application of Pulse Polarography and Pulse Anodic Stripping to the Determination of Selected Heavy Metals in Natural Waters--Part II: Application of Controlled Potential Coulometric Techniques to the Determination of Uranium,
W79-01517 5A

Sources of Heavy Metals in Sediments of the Hudson River Estuary,
W79-01678 5B

Determination of Stability Constants of Metal-Humic Acid Complexes by Potentiometric Titration and Ion-Selective Electrodes,
W79-01721 5A

Use of Continuous Ion Exchange for Removal of Environmental Contaminants from Waste Streams,
W79-01768 5D

Leather Tanning Industry-Sludge Problems Ahead,
W79-01779 5E

Sublethal Effects of Petroleum Hydrocarbons and Trace Metals Including Biotransformations, as Reflected by Morphological, Physiological, Pathological, and Behavioral Indices,
W79-01791 5C

Overview,
W79-01796 5C

Possible Trace Metal Mobilization of Selected Trace Elements from Oil-Impacted Sediments,
W79-01807 5C

Ecology and Pathology of Wildlife in Response to Spray Irrigation of Chlorinated Sewage Effluent - Phase I,
W79-01902 5C

Heavy Metal Additions to Waters of the Joplin Area, Tri-State Mining District, Missouri,
W79-01969 5B

HIGHWAYS
The Effects of Highway Construction on the Hydrogeologic Environment at Bowden, West Virginia,
W79-01975 5B

HISTOSOLS
Alternate Drying and Rewetting Effects on Chemical and Physical Properties and Moisture-Salinity Relationships of a Histosol,
W79-01699 2G

HUDSON RIVER
Sources of Heavy Metals in Sediments of the Hudson River Estuary,
W79-01678 5B

HUMIC ACIDS
Determination of Stability Constants of Metal-Humic Acid Complexes by Potentiometric Titration and Ion-Selective Electrodes,
W79-01721 5A

HUNGARY
The Development and Management of Karst Water Resources in the City of Pecs and its Vicinity, Hungary,
W79-01959 2F

HURON COUNTY (MICH)
Great Lakes Shoreline Damage Survey; Muskegon, Manistee, Schoolcraft, Chippewa, Alcona, and Huron Counties, Michigan, Appendix III,
W79-01531 4A

HYDRAULIC CONDUCTIVITY
Hydrologic Characteristics of Coal-Mine Spoils, Southeastern Montana,
W79-01542 5B

HYDRAULIC FRICTION
Hydraulic Friction Loss in Small Diameter Plastic Pipelines,
W79-01915 8B

HYDRAULIC MODELS
Effects of Construction of Liberty State Park on Hydraulic Characteristics of New York Harbor; Hydraulic Model Investigation,
W79-01518 8B

Navigation Conditions, Suck Bend Reach, Chattahoochee River, Alabama and Georgia; Hydraulic Model Investigation,
W79-01664 8B

Wave Forces on Causeway-Type Coastal Bridges,
W79-01983 8B

HYDRAULIC STRUCTURES
Air-Regulated Siphon Spillways at Spelga Dam,
W79-01925 8B

HYDRAULICS
Hydraulics and Stability of Tidal Inlets,
W79-01519 8B

Interim Report No. 2, Wabash River Basin Comprehensive Study Covering Reservoir Sites on Embarrass River, IL., and Clifty Creek and Patoka River, IN. Vol. III, Appendices D-F.
W79-01829 6B

HYDROCARBONS
Interactive Effects of Residues of Hydrocarbons, Chlorinated Hydrocarbons, and Heavy Metals on the Metabolism and Bioaccumulation of Petroleum Hydrocarbons in Marine Fish,
W79-01809 5C

HYDROELECTRIC POWER
Water Resources Appraisal for Hydroelectric Licensing, Kern River Basin, California.
W79-01835 8C

HYDROGEN ION CONCENTRATION
Influence of K on the Uptake, Translocation, and Reduction of Nitrate by Barley Seedlings,
W79-01693 3F

HYDROGEOLOGY
Hydrologic Problems in Karst Regions.
W79-01932 2F

Summary of Geohydrologic Relationships in the Lost River Watershed, Indiana, Applied to Water Use and Environment,
W79-01939 2F

Conceptual Models for Carbonate Aquifers: Revisited,
W79-01949 2F

Groundwater Potential of the Karst Regions of Alberta, Canada,
W79-01955 2F

Hydrogeology of a Cave Utilized for Public Water Supply: Rio Camuy Cave, Puerto Rico U.S.A.,
W79-01957 2F

Results of Tracing Experiments for Construction of Reservoirs in Karstic Regions,
W79-01976 8E

HYDROGRAPH ANALYSIS
Numerical Simulation of Watershed Response Using the Unified Transport Model - Part II Validation Studies,
W79-01947 2A

HYDROLOGIC CYCLE
Numerical Simulation of Watershed Response Using the Unified Transport Model - Part I Model Structure,
W79-01946 2A

Numerical Simulation of Watershed Response Using the Unified Transport Model - Part II Validation Studies,
W79-01947 2A

HYDROLOGIC MODELS
Hydrologic Interpretation of Basin Morphology
W79-01899 2A

HYDROLOGY
Interim Report No. 2, Wabash River Basin Comprehensive Study Covering Reservoir Sites on Embarrass River, IL., and Clifty Creek and Patoka River, IN. Vol. III, Appendices D-F
W79-01829 6E

IDAHO
Incentives for Improved Water-Use Efficiency Implementation Phase,

Process for Detoxification of Formaldehyde Containing Waste Waters,
W79-01876 5D

Apparatus for Purifying Waste Waters,
W79-01880 5D

Process for Removing Cyanide-Containing Components from Aqueous Media,
W79-01884 5D

Oil-Containing Effluent Treatment by Gravity Separation,
W79-01888 5D

INDUSTRIAL WATER

Status of the Closed-Cycle Concept Kraft Mill at Great Lakes Paper Co.,
W79-01773 3E

Rationalization and Environmental Problems of Beamhouse Operations,
W79-01778 5D

INFILTRATION

A Method of Promoting Penetration of Water into Tight, Sloping Soil Under Drip Irrigation,
W79-01719 3F

INFILTRATION RATES

The Use of Nonionic Surfactants on Soils,
W79-01571 2G

INFILTROMETERS

Partial Area Response on Small Semiarid Watersheds,
W79-01916 2E

INJECTION WELLS

Artificial Ground-Water Recharge as a Water-Management Technique on the Southern High Plains of Texas and New Mexico,
W79-01992 4B

INLETS (WATERWAYS)

Hydraulics and Stability of Tidal Inlets,
W79-01519 8B

Numerical Simulation of Tidal Hydrodynamics, Great Egg Harbor and Corson Inlets, New Jersey,
W79-01661 2L

INSTITUTIONS

Karstic Institutional Conflicts and Opportunities,
W79-01935 6E

INSTRUMENTATION

Problems in Automating the Monitoring of Surface Water Chemistry,
W79-01507 5A

Assembly for Mounting Hydraulic Soil Core Sampler on Tractor Front,
W79-01710 7B

INTERACTIVE COMPUTER SYSTEMS

Pattern Recognition Techniques Applied to Oil Identification,
W79-01747 5A

INTERCELLULAR SPACES

Nonionic Surfactant Effects on Growth and Porosity of Barley Roots,
W79-01564 2I

INTERNATIONAL HYDROLOGICAL DECADE

United States Participation in the International Hydrological Program 1975-.
W79-01509 2A

INTERNATIONAL HYDROLOGICAL PROGRAM

United States Participation in the International Hydrological Program 1975-.
W79-01509 2A

INTERTIDAL AREAS

Design of Field Experiments to Determine the Ecological Effects of Petroleum in Intertidal Ecosystems,
W79-01810 5C

Reconnaissance of the Intertidal and Shallow Subtidal Biotic Lower Cook Inlet,
W79-01824 5C

Airborne Multispectral Mapping of the Intertidal Zone of Southern Alaska,
W79-01825 5C

INTESTINAL MICROFLORA

Bdellovibrio and the Intestinal Flora of Vertebrates,
W79-01742 5F

INVERTEBRATES

Trawl Survey of the Epifaunal Invertebrates of Norton Sound, Southeastern Chukchi Sea, and Kotzebue Sound,
W79-01817 5C

INVESTMENT

Sequencing Competitive Expansion Projects,
W79-01561 6A

ION EXCHANGE

Recovering System for Chrome-Plating Wastewater Containing Chromic Acid (Kuromu mekki haisui no shori shisutemu),
W79-01767 5D

Use of Continuous Ion Exchange for Removal of Environmental Contaminants from Waste Streams,
W79-01768 5D

IOWA

Distribution and Density of Dolines in Areas of Mantled Karst,
W79-01944 2F

IRELAND

Air-Regulated Siphon Spillways at Spelga Dam,
W79-01925 8B

Influence of Karst on Engineering in Ireland,
W79-01973 8G

IRON

Nutrient Cycling and Productivity of Dystrophic Lake-Bog Systems (Part A), Appendix A: In Situ Experiments on the Dissolved and Colloidal State of Iron in an Acid Bog Lake,
W79-01597 5C

Nutrient Cycling and Productivity of Dystrophic Lake-Bog Systems (Part A) Appendix B: The Influence of Colloidal Organic Matter (COM) Upon Iron and Iron-Phosphorus Cycling in an Acid Bog Lake,
W79-01598 5C

IRON BACTERIA

Occurrence of Iron Bacteria in Ground Water Supplies of Alabama,
W79-01908 5B

IRON COMPOUNDS

The Removal of Arsenic(V) from Acidic Solutions,
W79-01765 5D

IRRIGATION

Alternate Drying and Rewetting Effects on Chemical and Physical Properties and Moisture-Salinity Relationships of a Histosol,
W79-01699 2G

A Method of Promoting Penetration of Water into Tight, Sloping Soil Under Drip Irrigation,
W79-01719 3F

Irrigation Timing-Its Influence on the Effects of Salinity and Waterlogging Stresses in Tobacco Plants,
W79-01720 3F

A Nonstructural Approach to Control Salt Accumulation in Ground Water,
W79-01735 5G

Incentives for Improved Water-Use Efficiency: Implementation Phase,
W79-01836 3F

Trickle Emitter for Subterranean Irrigation,
W79-01860 3F

Master-Satellite Irrigation Control System with Remote Proportional Timing,
W79-01861 3F

Flow Control Device for an Irrigation Ditch,
W79-01868 3F

Rotary Sprinkler Impact Arm Spring Adjustment,
W79-01872 3F

Regulated Flow-Reducing Device Particularly Useful for Drip Irrigation,
W79-01882 3F

The Impact of Energy Shortage and Cost on Irrigation for the High Plains and Trans Pecos Regions of Texas,
W79-01894 3F

Early Conflicts Over Effluent Irrigation in Missouri's Ozarks,
W79-01971 6E

Subsurface Water Behavior and Sewage Effluent Irrigation in the Missouri Ozarks,
W79-01972 5B

IRRIGATION DESIGN
An Introduction to Emission Uniformity,
W79-01686 8B

IRRIGATION DITCHES
Flow Control Device for an Irrigation Ditch,
W79-01868 3F

IRRIGATION EFFECTS
The Effect of Irrigation on the Survival and Development of Parasitic Nematode Larvae in Western Montana,
W79-01540 5C

Irrigation Effects on Vegetative and Reproductive Development of Three Soybean Cultivars,
W79-01708 3F

Alfalfa Water Use and Production on Dryland and Irrigated Sandy Loam,
W79-01715 3F

Corn and Alfalfa Production as Influenced by Irrigation and Salinity,
W79-01734 3C

IRRIGATION EFFICIENCY
Drip Irrigation at Superior Farming: Water Use Cut 30%, Fertilizer 50% by This Large Corporate Farm,
W79-01690 3F

Master-Satellite Irrigation Control System with Remote Proportional Timing,
W79-01861 3F

IRRIGATION ENGINEERING
[illegible] 8B

IRRIGATION PRACTICES
Sprinkler Irrigation Practices and Water Losses: Water Shortages Underline Need for Conservation,
W79-01673 3F

Drip Irrigation at Superior Farming: Water Use Cut 30%, Fertilizer 50% by This Large Corporate Farm,

LAKE MICHIGAN
Summary Report of the Pilot Study Program, Great Lakes Shoreland Damage Study,
W79-01528 4A

Great Lakes Shoreline Damage Survey; Brown, Douglas, and Racine Counties, Wisconsin, Appendix II,
W79-01530 4A

Great Lakes Shoreline Damage Survey; Muskegon, Manistee, Schoolcraft, Chippewa, Alcona, and Huron Counties, Michigan, Appendix III,
W79-01531 4A

Measurement of Coastal Bluff Recession from Aerial Photographs, Muskegon County, Michigan, Appendix VII,
W79-01533 4A

LAKE MICHIGAN BASIN
Environmental Status of the Lake Michigan Region, Volume 11. Natural Areas of the Lake Michigan Drainage Basin and Endangered or Threatened Plant and Animal Species,
W79-01555 6G

LAKE MICHIGAN (IL)
Illinois Coastal Zone Management Program, 2nd Year Work Product, Vol. VI. Public Participation Activities by League of Women Voters, Northeastern Illinois Pln. Commission, Lake Michigan Federation.
W79-01845 6B

LAKE MORPHOLOGY
Environmental Analyses in the Kootenai River Region, Montana,
W79-01512 7B

LAKE ONTARIO
Summary Report of the Pilot Study Program, Great Lakes Shoreland Damage Study,
W79-01528 4A

Engineering Studies for a Contract for Field Investigation of High Water Damage in Oswego County, New York, Appendix IV,
W79-01532 4A

Exchange of Carbon Dioxide Between the Atmosphere and Lake Ontario,
W79-01550 2K

Wetland Plant Communities Along the Eastern Shoreline of Lake Ontario,
W79-01644 2I

Short-Term Variation of the Chemical Composition of the Niagara River,
W79-01831 5A

LAKE POWELL (UTAH)
Major Element Geochemistry of Lake Powell,
W79-01511 2H

LAKE RESTORATION
Reclamation of Polluted Farm Ponds,
W79-01988 5G

LAKE SEDIMENTS
The Phosphorus Status of the Sediments of Three Eutrophic Lakes in Victoria,
W79-01697 5C

Factors Affecting Sediment Phosphorus Release in Lqke Carl Blackwell, Oklahoma,
W79-01984 5C

Contemporary and Historical Trace Metal Loadings to the Sediments of Four Lakes of the Lake Washington Drainage,
W79-01985 5B

LAKE SHORE PROTECTION
Lake Shore Protection Against Wind-Generated Waves,
W79-01917 2H

LAKE SHORES
Summary Report of the Pilot Study Program, Great Lakes Shoreland Damage Study,
W79-01528 4A

Great Lakes Shoreline Damage Survey, Saint Louis County, Minnesota, Appendix I.
W79-01529 4A

Great Lakes Shoreline Damage Survey; Brown, Douglas, and Racine Counties, Wisconsin, Appendix II,
W79-01530 4A

Great Lakes Shoreline Damage Survey; Muskegon, Manistee, Schoolcraft, Chippewa, Alcona, and Huron Counties, Michigan, Appendix III,
W79-01531 4A

Engineering Studies for a Contract for Field Investigation of High Water Damage in Oswego County, New York, Appendix IV,
W79-01532 4A

Measurement of Coastal Bluff Recession from Aerial Photographs, Muskegon County, Michigan, Appendix VII,
W79-01533 4A

Comparison of Field Data Collections to Data Collected Using Study Instruments in Muskegon and Manistee Counties, Michigan, Appendix VIII,
W79-01534 4A

LAKE SUPERIOR
Summary Report of the Pilot Study Program, Great Lakes Shoreland Damage Study,
W79-01528 4A

Great Lakes Shoreline Damage Survey, Saint Louis County, Minnesota, Appendix I.
W79-01529 4A

Great Lakes Shoreline Damage Survey; Brown, Douglas, and Racine Counties, Wisconsin, Appendix II,
W79-01530 4A

Great Lakes Shoreline Damage Survey; Muskegon, Manistee, Schoolcraft, Chippewa, Alcona, and Huron Counties, Michigan, Appendix III,
W79-01531 4A

Design Wave Information for the Great Lakes; Report 5, Lake Superior,
W79-01662 8B

The Effects of Advection-Diffusion Processes on the Eutrophication of Large Lakes, a Hypothetical Example: Lake Superior,
W79-01993 5C

LAKES
'Thermal Pollution' of Bodies of Water and the Hydrologic Aspects of the Problem,
W79-01505 5B

Nutrient Cycling and Productivity of Dystrophic Lake-Bog Systems (Part A), Appendix A: In Situ Experiments on the Dissolved and Colloidal State of Iron in an Acid Bog Lake,
W79-01597 5C

Nutrient Cycling and Productivity of Dystrophic Lake-Bog Systems (Part A) Appendix B: The Influence of Colloidal Organic Matter (COM) Upon Iron and Iron-Phosphorus Cycling in an Acid Bog Lake,
W79-01598 5C

Submerged Vegetation of the Rotorua and Waikato Lakes 3. Lake Rerewhakaiitu,
W79-01652 2H

Lake Shore Protection Against Wind-Generated Waves,
W79-01917 2H

An Unobtrusive Measure of the Recreational Value of a Lake,
W79-01986 6B

LAND MANAGEMENT
Inland Land Use Activities and Georgia's Coastal Waters.
W79-01651 4C

LAND SUBSIDENCE
Morphometric Analysis of Dolines for Predicting Ground Subsidence, Monroe County, West Virginia,
W79-01945 2F

LAND USE
Analysis of Current Land-Use and Zoning Versus Selected Environmental Factors in Drainage Basins Containing Lakes or Ponds,
W79-01589 2H

Application of LANDSAT Image Wetland Study and Land Classification in West Tennessee,
W79-01638 7B

The Verification of LANDSAT Data in the Geographical Analysis of Wetlands in West Tennessee,
W79-01639 7B

Louisiana Metropolitan Wetlands: A Planning Perspective, A Report to the Louisiana State Planning Office,
W79-01650 6B

Physical and Economic Feasibility of Nonstructural Flood Plain Management Measures,
W79-01833 6F

Environmental Assessment of Water Quality Management Plans.
W79-01844 5G

LANDFILLS
Application of Geotechnical Theories to the Landfill Disposal of Papermill Sludges,
W79-01620 5E

LANDSAT DATA
The Verification of LANDSAT Data in the Geographical Analysis of Wetlands in West Tennessee,
W79-01639 7B

LARVAL GROWTH STAGE
The Effect of Irrigation on the Survival and Development of Parasitic Nematode Larvae in Western Montana,
W79-01540 5C

LAS VEGAS VALLEY (NEV)
Water Conservation in the Las Vegas Valley: Pricing and Alternative Measures,
W79-01896 3D

LATENT HEAT
An Analysis of Sensible and Latent Heat Flow in a Partially Frozen Unsaturated Soil,
W79-01711 2G

LEACHATE
A Study of Leachate from Dredged Material in Upland Areas and/or in Productive Uses,
W79-01660 5B

Pollution Concentrations in Runoff Water from Refuse Piles,
W79-01892 5B

LEACHING
A Study of Leachate from Dredged Material in Upland Areas and/or in Productive Uses,
W79-01660 5E

Nutrient Uptake by Grass and Leaching Losses from Soluble and S-Coated Urea and KCl,
W79-01705 3F

Management of Irrigated Soybeans on a Moderately Coarse-Textured Soil in the Upper Midwest,
W79-01775 3F

Effect of Soil Mixtures and Irrigation Method on Leaching of N in Golf Greens,
W79-01777 5F

Evaluation of Nitrapyrin as a Means of Improving N Efficiency in Irrigated Sands,
W79-01847 3F

Pollution Concentrations in Runoff Water from Refuse Piles,
W79-01892 5B

LEAD
Metal Concentrations (AS, CD, CU, PB and ZN) in Shorthorn Sculpins, Myoxocephalus Scorpius (Linnaeus) and Arctic Char, Salvelinus Alpinus (Linnaeus), From the Vicinity of Strathcona Sound, Northwest Territories,
W79-01552 5B

Lead Accumulation Rates in Tissues of the Estuarine Teleost Fish, Gillichthys Mirabilis: Salinity and Temperature Effects,
W79-01667 5C

LEAST SQUARES METHOD
Transient Two-Dimensional Problems Utilizing the Least Squares Algorithm,
W79-01557 2C

LEECHES
Thermal Acclimation Induced Compensation in Biochemical Constituents of the Indian Freshwater Leech, Poecilobdella Viridis (Blanchard)
W79-01700 5C

LEGAL ASPECTS
Systematic Development of Institutional and Legal Prescriptions for Urban Water Use and Management,
W79-01891 6B

LEGISLATION
Adventures in Designing for 1984 Effluent Reduction,
W79-01608 5C

Survey of Orders of Conditions (Under Wetlands Protection Act) of the Conservation Commissions of Cape Cod, 1973-1977.
W79-01631 6B

Systematic Development of Institutional and Legal Prescriptions for Urban Water Use and Management,
W79-01891 6B

LIBYA
Hydrological Problems of Jufra Well Field Libya,
W79-01963 2F

LIME
The Removal of Arsenic(V) from Acidic Solutions,
W79-01765 5D

LIMESTONES
Dolomitization in the Floridan Aquifer,
W79-01749 2F

IQUID WASTES
Liquid Manure and Environment Protection, (In German),
W79-01628 5E

Utilization and Disposal of Liquid Manure at Small Available Space, (In German),
W79-01640 5E

ITTORAL
Marine Algal Vegetation in Shallow Water Around the Danish Island of Saltholm, the Sound,
W79-01996 5C

IVESTOCK
Livestock Farming and Environmental Protection, (In German),
W79-01605 5D

OAM
Alfalfa Water Use and Production on Dryland and Irrigated Sandy Loam,
W79-01715 3F

OCATING
The A, B, C's of Finding and Delineating Caves with Apparent Resistivity Measurements,
W79-01941 2F

OST RIVER (INDIANA)
Summary of Geohydrologic Relationships in the Lost River Watershed, Indiana, Applied to Water Use and Environment,
W79-01939 2F

OUISIANA
Louisiana Metropolitan Wetlands: A Planning Perspective, A Report to the Louisiana State Planning Office,
W79-01650 6B

UBBOCK COUNTY (TEXAS)
Analytical Study of the Ogallala Aquifer in Lubbock County, Texas, Projections of Saturated Thickness, Volume of Water in Storage, Pumpage Rates, Pumping Lifts, and Well Yields,
W79-01931 7C

YSIMETERS
A Study of Leachate from Dredged Material in Upland Areas and/or in Productive Uses,
W79-01660 5B

ADISON METROPOLITAN SEWERAGE ISTRICT (WISC)
Efficiency and Equity in Pricing Local Public Services: The Case of Wastewater,
W79-01544 5D

AGNESIUM CARBONATE
Color Removal from Textile Dye Waste Using Magnesium Carbonate,
W79-01776 5D

AINE
Design and Operation of Great Northern Paper Company's Secondary Treatment Facilities at East Millinocket, Maine,
W79-01616 5D

AJOR ELEMENT GEOCHEMISTRY
Major Element Geochemistry of Lake Powell,
W79-01511 2H

ANAGEMENT
Management of Local Water Systems in Alabama,
W79-01536 6E

Illinois Coastal Zone Management Program, 2nd Year Work Product, Vol. VI. Public Participation Activities by League of Women Voters, Northeastern Illinois Pln. Commission, Lake Michigan Federation.
W79-01845 6B

MANAGEMENT (ADMINISTRATIVE)
Innovative Management Concept for 208 Planning,
W79-01848 5G

MANGANESE
Organic Impurities from Industrial Waste Water Removal - By Treatment with Activated Carbon Containing Manganese Oxide(s) Useful in Chemical Industry.
W79-01703 5D

MANISTEE COUNTY (MICH)
Great Lakes Shoreline Damage Survey; Muskegon, Manistee, Schoolcraft, Chippewa, Alcona, and Huron Counties, Michigan, Appendix III,
W79-01531 4A

MAPPING
Use of Landsat Data to Relate Water Depth to Observed Area of Inundation in Coastal Marshes,
W79-01637 7B

Airborne Multispectral Mapping of the Intertidal Zone of Southern Alaska,
W79-01825 5C

MARINE ALGAE
Marine Algal Vegetation in Shallow Water Around the Danish Island of Saltholm, the Sound,
W79-01996 5C

MARKING
Improved Techniques for Marking and Sampling Band-Applied Fertilizers and Pesticides,
W79-01709 5A

MARSH MANAGEMENT
Wetlands of the United States: Their Extent and Their Value to Waterfowl and Other Wildlife,
W79-01635 6B

Louisiana Metropolitan Wetlands: A Planning Perspective, A Report to the Louisiana State Planning Office,
W79-01650 6B

MARSHES
Elite Attitudes Toward Marshlands in South Carolina,
W79-01648 6B

MARYLAND
Flood Plain Information: Muddy Branch, Montgomery County Maryland.
W79-01854 4A

Water Well Productivity Related to Photo-Lineaments in Carbonates of Frederick Valley, Maryland,
W79-01954 2F

MASS SPECTROSCOPY
Study of Water Treatment Effects on Organic Volatiles in Drinking Water,
W79-01722 5F

MASS TRANSFER
Trickle-Bed Reactor Performance, Part 1: Holdup and Mass Transfer Effects,
W79-01565 5D

Mass Transfer in Packed Beds with Two-Phase Flow,
W79-01567 2K

Transport of Reactive Solutes During Transient, Unsaturated Water Flow in Multilayered Soils,
W79-01921 2G

MASS TRANSFER MODEL
Pollution Concentrations in Runoff Water from Refuse Piles,
W79-01892 5B

MASSACHUSETTS
Survey of Orders of Conditions (Under Wetlands Protection Act) of the Conservation Commissions of Cape Cod, 1973-1977.
W79-01631 6E

Feeding and Growth Rates of Polinices Duplicatus Preying on Mya Arenaria at Barnstable Harbor, Massachusetts,
W79-01669 5C

Morphological Variation of Elodea in Western Massachusetts: Field and Laboratory Studies,
W79-01743 5C

The Spread of Several Introduced or Recently Invading Aquatic in Western Massachusetts,
W79-01744 5C

Genetic Damage to a Fern Population Growing in a Polluted Environment: Segregation and Description of Gametophyte Mutants,
W79-01745 5C

MATHEMATICAL MODEL
A Model for Predicting the Effects of Sewage Effluent on Wetland Ecosystems,
W79-01643 5C

MATHEMATICAL MODELS
Water Resources Planning for Rivers Draining into Mobile Bay,
W79-01510 4A

Simulation of Fluid-Rock Interactions in a Geothermal Basin,
W79-01516 2F

Conceptual and Mathematical Modeling of the Hanford Groundwater Flow Regime,
W79-01522 5B

Sequencing Competitive Expansion Projects,
W79-01561 6A

Investment Planning for Colorado River Salinity Control,
W79-01587 5G

Ralston Creek Hourly Precipitation Model,
W79-01727 2B

Decision Making in a Multiple-Use Approach to the Reclamation of Strip-Mined Lands,
W79-01730 5G

A Probability Model for Matching Suspects with Spills - or Did the Real Spiller Get Away.,
W79-01748 5A

Applications of Mixing Experiments to Estuaries,
W79-01911 2L

Mathematical Models of Dissolved Oxygen Concentration in Fresh Water,
W79-01998 5C

MATHEMATICAL STUDIES
A Finite Element Solution to a General Two-Dimensional Nonsymmetric Parabolic Partial Differential Equation,
W79-01559 2G

Sequencing Competitive Expansion Projects,
W79-01561 6A

Hydraulic Friction Loss in Small Diameter Plastic Pipelines,
W79-01915 8B

MAUMEE RIVER (OHIO)
Physical, Chemical, and Mineralogical Properties of Fluvial Unconsolidated Bottom Sediments in Northwestern Ohio,
W79-01926 2J

MEASUREMENT
Measurements of Phytoplankton-Protein Content with the Heated Biuret-Folin Assay,
W79-01995 5A

MEAT PROCESSING WASTES
Process and Apparatus to Treat Putrefactive Waste from Raw Fish and Meat.
W79-01647 5D

MECHANICAL EQUIPMENT
Improvement and Evaluation of Techniques for the Mechanical Removal and Utilization of Excess Aquatic Vegetation,
W79-01584 4A

MEMBRANE PROCESSES
Forward Osmosis Extractors: Theory, Feasibility and Design Optimization,
W79-01592 3A

Studies of Membrane Processes for Pulp Mill Pollution Control,
W79-01611 5D

MERCURY
Controlled Ecosystem Pollution Experiment: Effect of Mercury on Enclosed Water Columns. VIII. Summary of Results,
W79-01691 5C

The Contribution of Mercury and Chlorinated Organics from Urban Runoff,
W79-01918 5B

METABOLISM
The Influence of Constant and Cyclic Acclimation Temperatures on the Metabolic Rates of Panopeus Herbstii and Uca Pugilator,
W79-01685 5C

Interactive Effects of Residues of Hydrocarbons, Chlorinated Hydrocarbons, and Heavy Metals on the Metabolism and Bioaccumulation of Petroleum Hydrocarbons in Marine Fish,
W79-01809 5C

METALS
Metal Concentrations (AS, CD, CU, PB and ZN) in Shorthorn Sculpins, Myoxocephalus Scorpius (Linnaeus) and Arctic Char, Salvelinus Alpinus (Linnaeus), From the Vicinity of Strathcona Sound, Northwest Territories,
W79-01552 5B

Uptake of Zinc by the Aquatic Larvae of Simulium Ornatipes (Diptera: Nematocera),
W79-01696 5C

The Removal of Arsenic(V) from Acidic Solutions,
W79-01765 5D

Recovering System for Chrome-Plating Wastewater Containing Chromic Acid (Kuromu mekki haisui no shori shisutemu),
W79-01767 5D

METERING
Water Conservation in the Las Vegas Valley: Pricing and Alternative Measures,
W79-01896 3D

METHODOLOGY
A Study of Parameter Estimation Procedures of a Model for Lake Phosphorus Dynamics,
W79-01994 5C

MICHIGAN
Great Lakes Shoreline Damage Survey; Muskegon, Manistee, Schoolcraft, Chippewa, Alcona, and Huron Counties, Michigan, Appendix III,
W79-01531 4A

Measurement of Coastal Bluff Recession from Aerial Photographs, Muskegon County, Michigan, Appendix VII,
W79-01533 4A

Comparison of Field Data Collections to Data Collected Using Study Instruments in Muskegon and Manistee Counties, Michigan, Appendix VIII,
W79-01534 4A

Nutrient Cycling and Productivity of Dystrophic Lake-Bog Systems (Part A), Appendix A: In Situ Experiments on the Dissolved and Colloidal State of Iron in an Acid Bog Lake,
W79-01597 5C

Nutrient Cycling and Productivity of Dystrophic Lake-Bog Systems (Part A) Appendix B: The Influence of Colloidal Organic Matter (COM) Upon Iron and Iron-Phosphorus Cycling in an Acid Bog Lake,
W79-01598 5C

MICROBIAL DEGRADATION
Biodegradation of Oil Slicks in the Marine Environment,
W79-01913 5B

MICRONEKTON
Environmental Assessment of the Southeastern Bering Sea: Zooplankton and Micronekton,
W79-01816 5C

MICROORGANISMS
Potential Interaction of Microorganisms and Pollutants from Petroleum Development,
W79-01800 5C

MILLERS RIVER (MASS)
Genetic Damage to a Fern Population Growing in a Polluted Environment: Segregation and Description of Gametophyte Mutants,
W79-01745 5C

MINERALOGICAL PROPERTIES
Physical, Chemical, and Mineralogical Properties of Fluvial Unconsolidated Bottom Sediments in Northwestern Ohio,
W79-01926 2J

MINERALOGY
Physical, Chemical, and Mineralogical Properties of Fluvial Unconsolidated Bottom Sediments in Northwestern Ohio,
W79-01926 2J

MINNESOTA
Great Lakes Shoreline Damage Survey, Saint Louis County, Minnesota, Appendix I.
W79-01529 4A

Indian Creek Pumping Station, Mankato, Minnesota; Hydraulic Model Investigation,
W79-01663 8C

MINNESOTA RIVER BASIN
Comprehensive Water Quality Management for the State of South Dakota. 303(E) Basin Plan for the Minnesota River Basin.
W79-01846 5G

MISSISSIPPI
The Salt Marsh Flora of Mississippi,
W79-01632 2I

Distribution of Bluegreen Algae in a Mississippi Gulf Coast Salt Marsh,
W79-01750 5C

Factors Affecting the Use of an Artificial Beach: A Case Study on Mississippi Gulf Coast,
W79-01979 6B

Effects of Nutrient Enrichment of a Salt Marsh on Diatom Communities,
W79-01982 5C

MISSISSIPPI RIVER
A Study of Articulated Concrete Revetmer Mattress: Test and Analysis--Results of FY 197 Program,
W79-01513 8I

MISSISSIPPI WATER SYSTEMS
Model Aids Managerial Effectiveness in Munic pal Water Systems,
W79-01741 5C

MISSOURI
Geochemistry of Ground Water, Southwester Missouri,
W79-01535 5I

Computer Model for Predicting Pollution in th Missouri,
W79-01905 5I

Geophysical Investigations Over Karst Water i Southeastern Missouri,
W79-01942 2I

A Model for Relating Land Use and Ground water Quality in Southern Missouri,
W79-01964 2I

Heavy Metal Additions to Waters of the Joplin Area, Tri-State Mining District, Missouri,
W79-01969 5I

Early Conflicts Over Effluent Irrigation in Mi souri's Ozarks,
W79-01971 6I

Subsurface Water Behavior and Sewage Effl ent Irrigation in the Missouri Ozarks,
W79-01972 5I

Construction Methods which Recognize the Me chanics of Sinkhole Development,
W79-01974 8G

MISSOURI OZARKS
A Model for Relating Land Use and Ground water Quality in Southern Missouri,
W79-01964 2I

Early Conflicts Over Effluent Irrigation in Mi souri's Ozarks,
W79-01971 6I

Subsurface Water Behavior and Sewage Effl ent Irrigation in the Missouri Ozarks,
W79-01972 5I

MIXING
Applications of Mixing Experiments to Estu aries,
W79-01911 2I

MOBILE BAY (ALA)
Water Resources Planning for Rivers Drainin into Mobile Bay,
W79-01510 4A

MODEL STUDIES
The Use of Inclined Boreholes for Well Devel opment,
W79-01503 8I

Simulation of Fluid-Rock Interactions in a Geo thermal Basin,
W79-01516 2I

odel Analysis of Closed Systems in Karstic uifers,
/79-01952 2F

ow to a Well in an Unconfined Fractured uifer,
/79-01953 2F

Model for Relating Land Use and Ground-ter Quality in Southern Missouri,
/79-01964 2F

MOISTURE CONTENT
Linearized Moisture Flow with Loss at the Soil Surface,
W79-01704 2G

MOISTURE TENSION
Root-Sink Descriptions of Water Supply to Dry-land Wheat,
W79-01732 3F

Seedling Emergence as Related to Temperature and Moisture Tension,
W79-01751 4D

MOISTURE UPTAKE
Temperature Dependence of Water Uptake by Plant Roots,
W79-01910 2I

MOLLUSKS
The Effects of Short and Long Term Temperature Stress on Serotonin, Dopamine and Norepinephrine Concentrations in Molluscan Ganglia,
W79-01684 5C

MONITORING
Development of Technique for Detection of Low Molecular Weight Contaminant in Product Water from Water Purification or Water Reuse Systems,
W79-01578 5A

Alpha Radiation Monitoring of National Park Service Administered Caves in United States,
W79-01943 2F

Subsurface Water Behavior and Sewage Effluent Irrigation in the Missouri Ozarks,
W79-01972 5B

MONOAMINES
The Effects of Short and Long Term Temperature Stress on Serotonin, Dopamine and Norepinephrine Concentrations in Molluscan Ganglia,
W79-01684 5C

MONOMOLECULAR FILMS
Development and Evaluation of Improved Films for Suppressing Water Evaporation,
W79-01537 3B

MONROE COUNTY (W VA)
Morphometric Analysis of Dolines for Predicting Ground Subsidence, Monroe County, West Virginia,
W79-01945 2F

MONTANA
Environmental Analyses in the Kootenai River Region, Montana,
W79-01512 7B

The Effect of Irrigation on the Survival and Development of Parasitic Nematode Larvae in Western Montana,
W79-01540 5C

Montana's Water Resources: A Research Trust.
W79-01541 6E

Hydrologic Characteristics of Coal-Mine Spoils, Southeastern Montana,
W79-01542 5B

MORPHOEDAPHIC INDICES (LAKES)
Environmental Planning for an Alaskan Water-Oriented Recreational Area,
W79-01900 5C

MORPHOLOGY
Morphology,
W79-01795 5C

Environmental Planning for an Alaskan Water-Oriented Recreational Area,
W79-01900 5C

MORTALITY
Olisthodiscus Luteus (Chrysophyceae) I. Effects of Salinity and Temperature on Growth, Mortility and Survival,
W79-01682 5C

MOSQUITOES
Ecology and Pathology of Wildlife in Response to Spray Irrigation of Chlorinated Sewage Effluent - Phase I,
W79-01902 5C

MOVABLE-BED MODELS
Navigation Conditions, Suck Bend Reach, Chattahoochee River, Alabama and Georgia; Hydraulic Model Investigation,
W79-01664 8B

MUDDY BRANCH (MD)
Flood Plain Information: Muddy Branch, Montgomery County Maryland.
W79-01854 4A

MULTIPLE-PURPOSE PROJECTS
Decision Making in a Multiple-Use Approach to the Reclamation of Strip-Mined Lands,
W79-01730 5G

Water Resources Appraisal for Hydroelectric Licensing, Kern River Basin, California.
W79-01835 8C

MULTIPLE-PURPOSE RESERVOIRS
Interim Report No. 2, Wabash River Basin Comprehensive Study Covering Reservoir Sites on Embarrass River, IL, and Clifty Creek and Patoka River, in, Vol. I: Report.
W79-01827 6B

Interim Report No. 2, Wabash River Basin Comprehensive Study Covering Reservoir Sites on Embarrass River, IL, and Clifty Creek and Patoka River, IN. Vol. II: Appendices A-C.
W79-01828 6B

Interim Report No. 2, Wabash River Basin Comprehensive Study Covering Reservoir Sites on Embarrass River, IL., and Clifty Creek and Patoka River, IN. Vol. III, Appendices D-F.
W79-01829 6B

MULTIPURPOSE RESERVOIRS
Optimal Regulation Policies for a Multipurpose Reservoir with Seasonal Input and Return Function,
W79-01570 4A

MUNICIPAL WATER SYSTEMS
Model Aids Managerial Effectiveness in Municipal Water Systems,
W79-01741 5G

MUSKEGON COUNTY (MICH)
Great Lakes Shoreline Damage Survey; Muskegon, Manistee, Schoolcraft, Chippewa, Alcona, and Huron Counties, Michigan, Appendix III,
W79-01531 4A

Measurement of Coastal Bluff Recession from Aerial Photographs, Muskegon County, Michigan, Appendix VII,
W79-01533 4A

MUSSELS
Studies on the Mytilus Edulis Community in Alamitos Bay, California: VII. The Influence of Water-Soluble Petroleum Hydrocarbons on Byssal Thread Formation,
W79-01701 5C

MUTANTS
Genetic Damage to a Fern Population Growing in a Polluted Environment: Segregation and Description of Gametophyte Mutants,
W79-01745 5C

MYCOFLORA
Mycoflora of Activated Sewage Sludge,
W79-01548 5E

MYRIOPHYLLUM HETEROPHYLLUM
Microfloral Response to Aquatic Weed Decomposition,
W79-01746 5C

NATIONAL INCOME
The Upper Columbia Navigation Proposal.
W79-01843 4A

NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM
NBC Requests Exemption from Runoff Rules.
W79-01649 5G

NATURAL AREAS
Environmental Status of the Lake Michigan Region, Volume 11. Natural Areas of the Lake Michigan Drainage Basin and Endangered or Threatened Plant and Animal Species,

Hydro-Carpet Oil Spillage Containment and Recovery Device,
W79-01866 5G

Apparatus for the Continuous Measurement of the Concentration of Oil,
W79-01867 5A

Flow Control Device for an Irrigation Ditch,
W79-01868 3F

Collapsible and Expansible Barrage,
W79-01869 8A

Manoeuverable Weir,
W79-01870 8G

Method and Means of Treating Water Wells,
W79-01871 3B

Rotary Sprinkler Impact Arm Spring Adjustment,
W79-01872 3F

Method of Separation of Fluoride Ion From Water,
W79-01873 5F

Process for the Purification of Industrial Effluents,
W79-01874 5D

Method for Treating Aqueous Wastes Containing at Least 1% Proteinaceous Matter,
W79-01875 5D

Process for Detoxification of Formaldehyde Containing Waste Waters,
W79-01876 5D

Device for Treating Waste Water,
W79-01877 5D

Water Softening System,
W79-01878 5F

Apparatus for Purifying Waste Waters,
W79-01880 5D

Sludge Settling and De-Watering Apparatus,
W79-01881 5D

Regulated Flow-Reducing Device Particularly Useful for Drip Irrigation,
W79-01882 3F

Solar Photolysis of Water,
W79-01883 2K

Process for Removing Cyanide-Containing Components from Aqueous Media,
W79-01884 5D

Method and Apparatus for Purification of Water,
W79-01886 5D

Treatment of Aqueous Systems,
W79-01887 8G

Oil-Containing Effluent Treatment by Gravity Separation,
W79-01888 5D

Oil Spill Retrieval System,
W79-01889 5G

Liquid Waste Processing System,
W79-01890 5D

PATH OF POLLUTANTS
Possible Changes in Aerosol Composition Due to Departure from Equilibrium Conditions During Sampling,
W79-01554 5A

PATTERNS RECOGNITION
Pattern Recognition Techniques Applied to Oil Identification,
W79-01747 5A

PEACOCK SPRINGS (FLA)
Exploration and Environmental Investigation of the Peacock Springs Cave System,
W79-01961 2F

PEAK DISCHARGE
Flood Hazard Information: Clover Creek, Stillwater Creek and Stillwater Creek Tributaries, Loomis Corners, California.
W79-01851 4A

Flood Plain Information: Salt Creek and Tributaries, Olney, Texas.
W79-01852 4A

Flood Plain Information: Muddy Branch, Montgomery County Maryland.
W79-01854 4A

Flood Hazard Information: Sacramento River and Cottonwood and Battle Creeks, Cottonwood-Bend Area, California.
W79-01855 4A

Flood Plain Information: Bird Creek and Tributaries, Pawhuska, Oklahoma.
W79-01856 4A

Flood Plain Information: Provo River and Slate Canyon Creek, Provo, Utah.
W79-01857 4A

Flood Plain Information: Coal Creek and Tributaries, Henryetta, Oklahoma.
W79-01858 4A

Flood Plain Information: Panther and Bear Branches, Montgomery County, Texas.
W79-01859 4A

PEATS
Evaluation of Peat and Granular Inoculum for Soybean Yield and N Fixation Under Irrigation
W79-01702 3

PENETRATION
A Method of Promoting Penetration of Water into Tight, Sloping Soil Under Drip Irrigation
W79-01719 3

PENNSYLVANIA
Flood Plain Information: Pigeon Creek, Bentleyville, Fallowfield Township and Somerset Township, Pennsylvania.
W79-01850 4A

Flood Plain Information: Frankstown Branch Juniata River, Claysburg, Pennsylvania.
W79-01853 4A

Ecology and Pathology of Wildlife in Response to Spray Irrigation of Chlorinated Sewage Effluent - Phase I,
W79-01902 5

PERMEABILITY
Dolomitization in the Floridan Aquifer,
W79-01749 2

PERMIAN (TEXAS)
Hydrology of Karst Features in Evaporite Deposits of the Upper Permian in Texas,
W79-01965 2

PESTICIDE RESIDUES
Development of a New Technique for the Analysis of Pesticides in Water,
W79-01981 5

PESTICIDES
Improved Techniques for Marking and Sampling Band-Applied Fertilizers and Pesticides
W79-01709 5

State of the Art Report on Pesticide Disposal Research,
W79-01764 5

PETROGRAPHY
Dolomitization in the Floridan Aquifer,
W79-01749 2

PETROLEUM DEVELOPMENT
A Review of the Literature and a Selected Bibliography of Published and Unpublished Literature on Marine Birds of Alaska,
W79-01814 5

PETROLEUM HYDROCARBONS
The Effects of Petroleum Hydrocarbons on Chemoreception in Dungeness Crab Cancer Magister.
W79-01808 5

Environmental Assessment of Alaskan Continental Shelf. Final Reports of Principal Investigators, Vol 1, Biological Studies.
W79-01811 5

HALLUSIA
Filter-Feeding Ethology of Benthic Invertebrates (Ascidians). V. Influence of Temperature on Pumping, Filtration, and Digestion Rates and Rhythms in Phallusia Mamillata,
W79-01653 5C

HENOLS
Biodegradation of Phenolic Waste Liquors in Stirred-Tank, Packed-Bed, and Fluidized-Bed Bioreactors,
W79-01762 5D

HENYLALAMINE
Interaction of Chlorine and Organic Molecules--Effects of Inorganics,
W79-01903 5B

IOSPHATES
Microfloral Response to Aquatic Weed Decomposition,
W79-01746 5C

Eutrophication of Water Bodies: Insights for an Age-Old Problem,
W79-02000 5C

IOSPHORUS
Nutrient Cycling and Productivity of Dystrophic Lake-Bog Systems (Part A) Appendix B: The Influence of Colloidal Organic Matter (COM) Upon Iron and Iron-Phosphorus Cycling in an Acid Bog Lake,
W79-01598 5C

The Phosphorus Status of the Sediments of Three Eutrophic Lakes in Victoria,
W79-01697 5C

Differences Among Genotypes of Corn in the Kinetics of P Uptake,
W79-01733 3F

Effect of Fertilization on Penncross Creeping Bentgrass,
W79-01754 3F

Fertilizer Placement Effects on Soybean Seed Yield, N2 Fixation, and 33P Uptake,
W79-01782 3F

Relationship Between Soil Test and Small Grain Response to P Fertilization in Field Experiments,
W79-01786 3F

An Economic and Environmental Evaluation of Alternative Land Development Around New Hampshire Lakes,
W79-01904 5G

Effects of Nutrient Enrichment of a Salt Marsh on Diatom Communities,
W79-01982 5C

Factors Affecting Sediment Phosphorus Release in Lake Carl Blackwell, Oklahoma,
W79-01984 5C

The Effects of Advection-Diffusion Processes on the Eutrophication of Large Lakes, a Hypothetical Example: Lake Superior,
W79-01993 5C

A Study of Parameter Estimation Procedures of a Model for Lake Phosphorus Dynamics,
W79-01994 5C

OTO-OXIDATION REACTION
Solar Photolysis of Water,
W79-01883 2K

OTOPERIODISM
Some Effects of Photoperiod, Temperature, and Food on Emergence in Three Species of Chironomidae (Diptera),
W79-01688 5C

PHREATOPHYTES
Reducing Phreatophyte Transpiration,
W79-01562 3B

PHYSICAL PROPERTIES
Physical, Chemical, and Mineralogical Properties of Fluvial Unconsolidated Bottom Sediments in Northwestern Ohio,
W79-01926 2J

PHYSIOLOGY
Physiological and Behavioral Effects,
W79-01794 5C

PHYTOPLANKTON
Consequences of Periodic Applications of Copper Sulfate and Simazine for Phytoplankton Control in Catfish Ponds,
W79-01672 5C

Effects of Crude Oils on the Growth of Arctic Marine Phytoplankton,
W79-01784 5C

Measurements of Phytoplankton-Protein Content with the Heated Biuret-Folin Assay,
W79-01995 5A

PICTORIAL INFORMATION PROCESSOR
Pattern Recognition Techniques Applied to Oil Identification,
W79-01747 5A

PIEZOMETERS
Remote Sensing of Water Levels in Small-Diameter Wells,
W79-01924 7B

PIGEON CREEK (PA)
Flood Plain Information: Pigeon Creek, Bentleyville, Fallowfield Township and Somerset Township, Pennsylvania.
W79-01850 4A

PLANKTON
Environmental Assessment of the Southeastern Bering Sea: Zooplankton and Micronekton,
W79-01816 5C

PLANNING
United States Participation in the International Hydrological Program 1975-.
W79-01509 2A

Water Resources Planning for Rivers Draining into Mobile Bay,
W79-01510 4A

Model Aids Managerial Effectiveness in Municipal Water Systems,
W79-01741 5G

Wabash River Basin Comprehensive Study. Vol I. Main Report,
W79-01830 6B

Physical and Economic Feasibility of Nonstructural Flood Plain Management Measures,
W79-01833 6F

A Land Study for Downtown Lake Charles,
W79-01838 6B

Environmental Assessment of Water Quality Management Plans.
W79-01844 5G

Comprehensive Water Quality Management for the State of South Dakota. 303(E) Basin Plan for the Minnesota River Basin.
W79-01846 5G

Innovative Management Concept for 208 Planning,
W79-01848 5G

Karstic Institutional Conflicts and Opportunities,
W79-01935 6E

The Roles of Water Conservation Values in Community Policy,
W79-01987 3D

A Manual for Hydrologic Time Series Deseasonalization and Serial Dependence Reduction,
W79-01989 7C

North Slope Borough Water Study, A Background for Planning,
W79-01991 5D

PLANT BREEDING
Testing Salt Tolerance Variability Among Tall Wheatgrass Lines,
W79-01879 3C

PLANT GROWTH
Uptake and Translocation of a Nonionic Surfactant by Barley,
W79-01563 2I

Irrigation Effects on Vegetative and Reproductive Development of Three Soybean Cultivars,
W79-01708 3F

Environmental Planning for an Alaskan Water-Oriented Recreational Area,
W79-01900 5C

Measurements of Phytoplankton-Protein Content with the Heated Biuret-Folin Assay,
W79-01995 5A

PLANT MORPHOLOGY
Morphological Variation of Elodea in Western Massachusetts: Field and Laboratory Studies,
W79-01743 5C

PLANT POPULATIONS
Environmental Status of the Lake Michigan Region, Volume 11. Natural Areas of the Lake Michigan Drainage Basin and Endangered or Threatened Plant and Animal Species,
W79-01555 6G

A Comparison of Plant Succession and Bird Utilization on Diked and Undiked Dredged Material Islands in North Carolina Estuaries,
W79-01659 5C

Preliminary Guide to Wetlands of the West Coast States; Major Associations and Communities Identified.
W79-01665 2I

PLANTING MANAGEMENT
Pregermination Requirements and Establishment Techniques for Salt Marsh Plants,
W79-01641 2I

PLASTIC PIPES
Hydraulic Friction Loss in Small Diameter Plastic Pipelines,
W79-01915 8B

PLATTE RIVER BASIN (NEB)
Application of Remote Sensing in Estimating Evapotranspiration in the Platte River Basin,
W79-01521 7B

POCAHONTAS COUNTY (WVA)
Chloride Ion Variations in Some Springs of the Green-Brier Limestone Karst of West Virginia,
W79-01967 5B

POLAROGRAPHIC ANALYSIS
Part I: Application of Pulse Polarography and Pulse Anodic Stripping to the Determination of Selected Heavy Metals in Natural Waters--Part II: Application of Controlled Potential Coulometric Techniques to the Determination of Uranium,

U.S. GOVERNMENT PRINTING OFFICE: 1979-281-061/16

CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Illinois State Water Survey.
- Metropolitan water resources planning and management at the Center for Urban and Regional Studies of University of North Carolina.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Center of the University of Wisconsin.
- Eutrophication at the Water Resources Center of the University of Wisconsin.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.
- Water-related aspects of nuclear radiation and safety at the Oak Ridge National Laboratory.
- Water resource aspects of the pulp and paper industry at the Institute of Paper Chemistry.

Supported by the Environmental Protection Agency in cooperation with WRSIC

- Effect on water quality of irrigation return flows at the Department of Agricultural Engineering of Colorado State University.
- Agricultural livestock waste at East Central State College, Oklahoma.
- Municipal wastewater treatment technology at the Franklin Institute Research Laboratories.

Subject Fields

- 1 NATURE OF WATER
- 2 WATER CYCLE
- 3 WATER SUPPLY AUGMENTATION AND CONSERVATION
- 4 WATER QUANTITY MANAGEMENT AND CONTROL
- 5 WATER QUALITY MANAGEMENT AND PROTECTION
- 6 WATER RESOURCES PLANNING
- 7 RESOURCES DATA
- 8 ENGINEERING WORKS
- 9 MANPOWER, GRANTS, AND FACILITIES
- 10 SCIENTIFIC AND TECHNICAL INFORMATION

INDEXES
